The ABC's of ABG's TM Robert F. Moran, Timothy N. Liesching, 2018-07-01 When a patient is brought into a trauma center in extremis, or becomes that way during a hospital stay, the intervention mantra is airway, breathing and circulation—the ABC's. We provide the nonspecialist physician, and those in the participating and supporting professions, a quick overview of the meaning of the testing terms in this environment. Many tests, added singly or in small groups over time as clinical and measurement technology evolved, but whose rationale may have become less clear, are defined and explained. Our format is simple—a brief overview of the physiologic environment and then the encyclopedic dictionary of the terminology. We include common terms as well as some of the confusing uses of terms besides lesser known facts influencing their clinical use on the basis of the analytical, medical, and managerial experience of the authors. Keep it in your lab coat pocket—you'll find it useful in understanding and teaching!

*Focus on Sickle Cell Research* Ralph L. Plasmar, 2004 Sickle cell anaemia is an inherited blood disorder, characterised primarily by chronic anaemia and periodic episodes of pain and occurring in approximately 1 in every 400 African-American infants born in the United States each year. Individuals of Mediterranean, Arabian, Caribbean, South and Central

American, and East Indian ancestry can also be affected. The underlying problem involves haemoglobin, a component of the red cells in the blood. The haemoglobin molecules in each red blood cell carry oxygen from the lungs to the body organs and tissues and bring back carbon dioxide to the lungs. In sickle cell anaemia, the haemoglobin is defective. After the haemoglobin molecules give up their oxygen, some of them may cluster together and form long, rod-like structures. These structures cause the red blood cells to become stiff and to assume a sickle shape. Unlike normal red cells, which are usually smooth and donut-shaped, the sickled red cells cannot squeeze through small blood vessels. Instead, they stack up and cause blockages that deprive the organs and tissue of oxygen-carrying blood. This process produces the periodic episodes of pain and ultimately can damage the tissues and vital organs and lead to other serious medical problems. Unlike normal red blood cells, which last about 120 days in the bloodstream, sickled red cells die after only about 10 to 20 days. Because they cannot be replaced fast enough, the blood is chronically short of red blood cells, a condition called anaemia. Sickle cell anaemia is caused by an error in the gene that tells the body how to make haemoglobin. The defective gene tells the body to make the abnormal haemoglobin that results in deformed red blood cells. This book gathers the latest research in this important field.
