*The Digital Challenge for Libraries* Ralph Blanchard,2005 Public and university libraries are at a crossroads, hard-pressed by competition from

Internet search engines, declining budgets and changes in popular culture. Libraries must respond aggressively. Otherwise they will be marginalized by the impact of digital technology on their traditional customer base. Author Ralph Blanchard, drawing on twenty years of experience as an information services entrepreneur, argues that it is irresponsible for librarians to simply turn academic tasks over to search engines, as many do. Instead, libraries should expand digital services and, using the tactics and strategies of successful for-profit information service businesses, reconnect with their customers by promoting themselves as 21st Century information experts. Topics in this wide-ranging study include: The library as a service business Change, risk and unintended consequences The Internet search engine business model Problems with students using search engines The evolution of ambient information Music and information technology Millennials as library customers Hiring and training library information workers Push and viral marketing strategies for libraries The Digital Challenge for Libraries calls for new initiatives by librarians and for a rekindling of interest in the vital role libraries play in an informed, prosperous and democratic society.

**Wireless Network Design** Jeff Kennington,Eli Olinick,Dinesh Rajan,2010-11-10 This book surveys state-of-the-art optimization modeling for design, analysis, and management of wireless networks, such as cellular and wireless local area networks (LANs), and the services they deliver. The past two decades have seen a tremendous growth in the deployment and use of wireless networks. The current-generation wireless systems can provide mobile users with high-speed data services at rates substantially higher than those of the previous generation. As a result, the demand for mobile information services with high reliability, fast response times, and ubiquitous connectivity continues to increase rapidly. The optimization of system performance has become critically important both in terms of practical utility and commercial viability, and presents a rich area for research. In the editors' previous work on traditional wired networks, we have observed that designing low cost, survivable telecommunication networks involves extremely complicated

processes. Commercial products available to help with this task typically have been based on simulation and/or proprietary heuristics. As demonstrated in this book, however, mathematical programming deserves a prominent place in the designer's toolkit. Convenient modeling languages and powerful optimization solvers have greatly facilitated the implementation of mathematical programming theory into the practice of commercial network design. These points are equally relevant and applicable in today's world of wireless network technology and design. But there are new issues as well: many wireless network design decisions, such as routing and facility/element location, must be dealt with in innovative ways that are unique and distinct from wired (fiber optic) networks. The book specifically treats the recent research and the use of modeling languages and network optimization techniques that are playing particularly important and distinctive roles in the wireless domain.
