Microcurrent: Advanced Wound Healing John Hache, 2018-09 The care and treatment of wounds has long been attributed to the western medical system, which has developed within itself a method for treating wounds that can in effect extend the duration of the wound, and cause excruciating pain in the process. Wounds or pain can become such a detriment on people's lives that they have all but given up. Dr. John Hache has spent years of his life helping patients in these situations find relief from this pain. With Microcurrent technology we have the power to restore that life to them. This illustrated book aims to examine the current epidemic in the prescription of harmful medications for the management of acute and chronic pain as well as the reasons behind delayed wound healing. We will consider why wounds take so long to heal, and why a lot of them do not heal at all; furthermore, we will show you a non-invasive way to accelerate their repair. The prevalence of prescription medications and surgical intervention within the medical field has prevented, and still prevents, medical professionals from seeing the advantages that alternative methods can produce. Within this book we will go over individual cases, a full case study with over 100 participants, and reveal specific step-by-step protocols for a variety of types of wounds, both basic, and severe that you can do with your microcurrent technology. These studies presented within reveal remarkable evidence that correct use of microcurrent technology, could-right now-replace a portion of the current medical practices in the treatment of wound healing. Dr. John Hache earned a PhD in Integrative Medicine from Quantum University. His thesis focused on research and practice in the healing of wounds using microcurrent technology.

Wound Management for the Advanced Practitioner Terry Swanson, Margo Asimus, Bill McGuinness, 2014-10-21 Increasingly, wound management is recognised as a specialised area of practice. Advances in wound-care products, surgical interventions, and social-support options create an often bewildering array of knowledge for healthcare practitioners. This textbook opens with a focus on the core elements of effective wound management: an understanding of how wounds heal and what inhibits wound healing, rigorous assessment, use of outcome measures, evidence-based approaches to practice, and an understanding of how clinical research is done. Key aspects of wound-bed preparation and management - diagnostic investigations, assessment and management of non-viable tissue, infected wounds, dressings and technology, pharmacological therapy, and acute wounds - are then elucidated. Optimal management of commonly-encountered wounds (venous leg ulceration, arterial and mixed arterial-venous ulceration, inflammatory ulcers, pressure injury, and the high-risk foot) and unusual wounds is described. The path to professionalisation of wound management in Australia is charted. The book ends with a list of wound care products (types, properties, uses, distributor-contact details). The editors and specialist contributors to this text have aimed to build on the foundations provided by the numerous basic, introductory-level textbooks in the field to provide an authoritative, comprehensive, and up-to-date textbook for wound managers who wish to further develop their knowledge and skills.

Advances in Wound Healing Materials Willi Paul, 2015-06-11 Wound healing and wound care technologies are an ever expanding field with the advancement of materials science, biomedicine and tissue engineering. In the year 2011 the global wound care market generated US\$ 6,500 million with an annual growth rate of 7.5%. The global advanced wound care products market share in 2023 is predicted to be approximately US\$ 16,300 million. This book discusses the evolution of wound care devices and protocol over the years and different technologies being used in the present day wound care treatment. New strategies involving engineered tissues and drug delivery to mimic the natural wound healing milieu are discussed. The use of cytokine growth factors enhances chronic wound healing particularly for burn wound healing. Prevention of scarring, keloid formation or contractures and a cosmetically acceptable healing is a challenge even now. Skin tissue engineering was the first successfully clinically applied product in regenerative medicine. Bioengineered skin seeded with fibroblast and keratinocyte cells could form a permanent solution that do not require skin grafting or

as a temporary cover for burns prior to grafting. Cell attachment, proliferation and tissue formation in a three-dimensional porous scaffold can be engineered for specific application. These cell based skin substitutes had significant wound healing and scar reducing effect on patients. Gene-activated dermal equivalent is another emerging approach for the healing of full thickness incision wounds with good remodelling of the skin. The book also describes similar latest developments on wound healing science and research. The target audiences are wound care professionals, researchers working on wound healing technology and skin tissue engineering; as well as graduate students and industries that need to understand the aspects of wound healing and technological orientation towards successful commercialisation.

Wound Healing Research Prasun Kumar, Vijay Kothari, 2021-07-20 This book presents the latest knowledge on both the physiological and the microbiological aspects of wound healing. Fresh insights into the process of cutaneous wound healing are described, which involves tissue regeneration and repair processes consisting of a sequence of molecular and cellular events. The management of infected wounds is then discussed in detail, covering the roles of traditional medicine practices, novel anti-infective formulations, non-antibiotic approaches, and probiotic bacteria. A section devoted to the interdisciplinary approach to wound care addresses topics including in vitro and in vivo research models, the development of advanced wound dressings, tissue engineering, and the potential applications of bioscaffolds. The authors are all leading researchers in the field. This book is an attempt to showcase current research status and future directions in the area of wound-healing research, which must be of interest to a large group of readers and researchers interested in this field.

Innovations and Advances in Wound Healing Seung-Kyu Han, 2023-03-27 This book presents state of the art knowledge on new techniques and materials that can improve functional and aesthetic results in wound healing while reducing invasiveness, based on the author's extensive personal experience. The aim is to equip the practitioner with all the information required in order to select a strategy that will accelerate wound healing and minimize both the risk of complications and scar formation after the wound has fully healed. The opening chapters set the stage by providing an overview of wound healing, including brief descriptions of the anatomy of the skin, the wound healing process, and advanced wound dressings. A full description follows of the various methodologies employed in repairing acute wounds with the goal of achieving optimal functional and cosmetic outcomes while utilizing the safest and least invasive method. Treatment protocols that have proven successful in closing nonhealing and/or delayed healing chronic wounds are then presented. In addition, a chapter addresses aesthetic procedures using advanced technology in wound healing. The closing chapter presents author's experience with the establishment a hospital wound dressing team.

Advanced Wound Care Therapies for Non-Healing Diabetic, Venous, and Arterial Ulcers U. S. Department of Veterans Affairs, Health Services Research & Development Service, 2013-05-04 Chronic ulcers (i.e., ulcers that are unresponsive to initial therapy or that persist despite appropriate care) are estimated to affect over 6 million people in the United States. The incidence is expected to increase as the population ages and as the number of individuals with diabetes increases. Chronic ulcers negatively affect the quality of life and productivity of the patient and represent a substantial financial burden to the health care system. Lower extremity ulcers, especially those attributed to either diabetes, venous disease, or arterial disease comprise a substantial proportion of chronic ulcers. Approximately 15% to 25% of individuals with diabetes develop a foot ulcer at some point in their lifetime and an estimated 12% of those patients require lower extremity amputation. Healing is complicated by diabetic neuropathy and susceptibility to infection. Venous disease accounts for the majority of chronic lower extremity ulcers. Venous hypertension secondary to various causes results in damage to vessel walls and ultimately leads to skin breakdown. Arterial ulcers are less common and are a result of impaired circulation which can affect healing lead to ulceration. Standard treatment for diabetic ulcers includes debridement of necrotic tissue, infection control, local ulcer care, mechanical off-loading, management of blood glucose levels, and education on foot care. For

venous ulcers, standard treatment typically includes the use of mechanical compression and limb elevation to reverse tissue edema and improve venous blood flow. Care for ulcers caused by arterial insufficiency is centered on reestablishing blood flow and minimizing further loss of tissue perfusion. If ulcers do not adequately heal with standard treatment, additional modalities may be required – these are often termed “advanced wound care therapies.” Lower extremity ulcers are frequently classified etiologically as diabetic, venous or arterial, though overlap may exist. Treatment modalities and wound care therapies are often selected based on the ulcer characteristics as well as patient factors, past treatment, and provider preference. A large and growing array of advanced wound care therapies of different composition and indications have been developed though their efficacy, comparative effectiveness and harm is not well established. The purpose of this review is to synthesize the evidence on therapies for non-healing diabetic, venous, and arterial lower extremity ulcers and is intended to provide an evidence base to guide clinical practice and policy needs within the VA. We recognize that a non-healing ulcer is likely a result of multiple factors and comorbid conditions. We group studies in the review according to the study authors' description of the included ulcer type. The review focuses on FDA-approved therapies and examines clinically relevant outcomes. We address the following key questions: Key Question #1. What are the efficacy and harms of therapies for diabetic ulcers? Is efficacy dependent on ancillary therapies? Does efficacy differ according to patient demographics, comorbid conditions, treatment compliance, or activity level? Key Question #2. What are the efficacy and harms of therapies for venous ulcers? Is efficacy dependent on ancillary therapies? Does efficacy differ according to patient demographics, comorbid conditions, treatment compliance, or activity level? Key Question #3. What are the efficacy and harms of therapies for arterial ulcers? Is efficacy dependent on ancillary therapies? Does efficacy differ according to patient demographics, comorbid conditions, treatment compliance, or activity level?
