*Pediatric and Adult Anesthesiology Simulation Education* Claire Sampankanpanich Soria, Suraj Trivedi, 2022-04-11 This book helps prepare anesthesiology residents for safe practice of pediatric anesthesia. It features 26 index cases, which are classic clinical scenarios - all covering a spectrum of pediatric anesthesia, neuro-anesthesia, cardiac anesthesia, regional anesthesia, and anesthesia and critical care medicine. Chapters are divided into case-based formats with each chapter containing a scenario layout, useful equipment, major teaching points for an after simulation debrief, and a learner evaluation form. This tiered education method will assist learners in working through essential team building skills, increasing their knowledge base and finally having concrete items in which to further their professional skills. Each chapter starts with a learning objective and presents the simulation case before launching into the case progression, detailing how the simulated patient's vital signs, physical exam findings, and clinical picture change over the course of the simulation. They are concluded with a master checklist of items the learner should accomplish during the course of the simulation along with a section summary and important teaching points. Pediatric and Adult Anesthesiology Simulation Education is designed to be used by both academic programs and private practice groups. It is beneficial to anesthesiology residents who are currently in training as well as those who have recently graduated and are preparing for board exams.

*Anesthesiology: A Problem-Based Learning Approach* Tracey Straker, Shobana Rajan, 2018-10-15 Linking existing knowledge to new knowledge by presenting it in the form of a case or a problem is a popular and effective educational approach resulting in better retention of the knowledge and improved ability to apply that knowledge to solve real problems. This problem-based learning (PBL) method was introduced into medical education at McMaster University in Ontario, Canada, in 1969. Since then it has been widely incorporated into secondary, undergraduate, and graduate education in a variety of disciplines worldwide. This new volume for the Anesthesiology Problem-Based

Learning series reviews topics in general anesthesiology utilizing the PBL approach. Each chapter deals with conditions and problems in anesthesia practice presented as a case stem with questions to encourage critical thinking, followed by an evidence-based discussion and multiple-choice questions for self-assessment. Current in its knowledge of organ systems and management, the text keeps pace with new technology, new drugs, and new surgical techniques coupled with current guidelines for anesthetic management. Cases highlight the practical issues that arise in the operating room and offers solutions for them. The book can be used to review an upcoming clinical case or as a PBL tool. The Stem Case and Key Questions and Discussion sections can serve as the basis for interactive learning experiences for study groups or as a broad yet in-depth clinical review of the specialty for the individual learner. Self-assessment questions can be used as a measure of knowledge acquisition or simply as a question bank to prepare for examinations.

**Simulators in Anesthesiology Education** Lindsey C. Henson, Andrew C. Lee, 2013-06-29 In the past ten years, full-scale simulation training has become dramatically more evident in undergraduate and graduate medical education. This increase has been due primarily to two factors: the development of new computer-driven technology and an interest in simulation-specific training techniques. Technologically, simulators have evolved from simple anatomical reproductions to full-scale accurate reproductions of anatomy and physiology powered by multiple computers. High-technology simulation centers run by teams of faculty are emerging as integral tools in fulfilling medical centers' educational missions. In addition, educational techniques specific to simulation, which have been developed and used by other industries for over half a century, are being applied to medical training. Aviation and aerospace have used sophisticated simulation since the 1950s to train pilots and astronauts. Extrapolating these methods for use in the medical world has been a natural course of events, particularly in specialties that require some of the same basic thought processes and interactions required of the pilot or astronaut. It is not surprising, then, that anesthesiology would be the medical specialty to take the lead in adding simulation training to its educational programs. The anesthesiologist's job in the operating room is similar to that of a pilot in a cockpit, not in the specific tasks, but in decision making, technological and human interfaces, and crisis management.
