A Direct Reading Phase Angle Meter Robert Pringle Chapman,1949 A meter is constructed for the measurement of phase differences of voltages in the lover audio range. This meter possesses many distinct advantages over the prevailing types in range, accuracy, and ease of operation. To test the meter, calculations are made of the phase change in a transmission line at various frequencies, and the results checked with the readings on the phase meter. A very good agreement was found between experimental and predicted values. In the construction of the meter two voltages 90° out of phase are required. These are obtained by the use of a three phase oscillator and Scott transformer connection. This method is selected as it will not spoil the adjustment of the phase meter with frequency change. --

Position Sensing Hans Walcher,2014-05-12 Position Sensing: Angle and Distance Measurement for Engineers focuses on the electrical measurement of angles and distances. The publication first elaborates on industrial principles and sensors and measurement systems. Discussions focus on measurement technology, terms used in information technology, methods of measurement, analogue angle and displacement sensors, features of processes using a digital-incremental measurement base, electromechanical position sensing systems, and capacitive scanning. Carrier frequency scanning, electromagnetic pulse generator, photoelectric position sensing systems, distance measurement by the pulse-time delay method, laser gyroscope, and systems with analogue measurement and subsequent analogue-to-digital conversion are also discussed. The manuscript then examines intelligent sensors and connection of measurement systems. Topics cover electrical couplings for fine and coarse measurement systems, mechanical links for converting longitudinal to angular motion, general properties of intelligent sensors, and interconnection of intelligent sensors. The text is highly recommended for mechanical engineers and measurement and control technicians.

Intelligent Autonomous Vehicles International Federation of Automatic Control,1993-09-06 There is an increasing range of applications in which a robot has to operate in large unstructured and uncertain environments - including military cross country missions, fire fighting, construction, nuclear plant inspections, inspecting and repairing subsea structures, assembling space stations, as well as in intelligent automobiles. Uncertainty dominates the problem domain for intelligent autonomous vehicles (IAVs) through sensing the environment and vehicle state, interpreting the data, assessing the situation, adapting to changes in the environment or tasking, replanning, navigation and piloting. IFAC, recognising the industrial, technical and economic significance of IAV research, established an International Working Party to promote research and dissemination of results in IAV systems. The IAV-93 Southampton Workshop and these resulting proceedings exemplify the vitality and significant progress made by leading IAV researchers worldwide.
