*Soilborne Microbial Plant Pathogens and Disease Management, Volume Two P.*

Narayanasamy, 2019-10-08 Crop disease management strategies revolve around the principles of exclusion, eradication and immunization. Cultural practices are aimed at preventing or reducing the accumulation of pathogen population (inoculum). Development of cultivars with genetic resistance by transgressing resistance gene(s) through traditional breeding procedures or biotechnological techniques is the most effective and acceptable strategy, as it is environment-friendly and does not need any additional cost to the grower. Assessment of different grades of resistance of cultivars or genotypes to soilborne microbial pathogens has been possible by quantifying pathogen populations or their DNA contents in the test plants by applying biological and molecular methods. This second volume of a two-volume set focuses on the soilborne microbial plant pathogens and the diseases caused by them. The book provides information on ecology and epidemiology of soilborne microbial plant pathogens and various strategies applicable for effective management of diseases. Chapters cover exclusion and prevention strategies; improvement of host plant resistance; biological management; application of chemicals; and integration of these disease management strategies. Features Discusses various aspects of soilborne microbial plant pathogens to develop effective methods of managing diseases. Presents information on epidemiology and ecology of soilborne microbial plant pathogens. Facilitates the application of management strategies alone or in combination with others for effective suppression of disease development. Features information on application of biotic and abiotic biological control agents (BCAs) to suppress pathogen development either by directly acting on the pathogen(s) or indirectly by enhancing host resistance to the pathogens. Employs biotic and abiotic biocontrol agents either to replace or reduce the use of chemicals is an achievable approach for managing the soilborne microbial pathogens.

*Arthroplasty* Alessandro Rozim Zorzi, Hechmi Toumi, Eric Lespessailles, 2023-03-08 Osteoarthritis is the most common form of arthritis and cause of joint pain in adults. It affects more than 500 million people worldwide. Patients develop osteoarthritis when the structure of the protective cartilage that covers the bones begins to deteriorate. Recent research shows that multiple drugs in development are promising to treat osteoarthritis. Yet, most physicians agree that we still do not have enough effective treatments for this condition. What works for one person might not work for someone else. Consequently, osteoarthritis research is very important because understanding what causes osteoarthritis or why it progresses remains controversial. In fact, although articular cartilage is the

primary target of the disease, both subchondral bone and synovium are often actively involved. This book describes the details of both surgical and non-surgical treatment options for osteoarthritis.
