Military Technology Ron Fridell,2008 An introduction to military technology, looking at the advanced weaponry and machinery employed by military forces around the world.

American Military Technology Barton C. Hacker,Margaret Vining,2007-11-29 The growth of American engineering and science has affected military technology, organization, and practice from the colonial era to the present day—even as military concerns have influenced, and often funded, domestic engineering programs and scientific development. *American Military Technology* traces the interplay of technology and science with the armed forces of the United States in terms of what Hacker and Vining view as epochs: 1840-1865, the introduction of modern small arms, steam power, and technology, science, and medicine; 1900-1914, the naval arms race, torpedoes and submarines, and the signal corps and the airplane; and 1965-1971, McNamara's Pentagon, technology in Vietnam, guided missiles, and smart bombs. The book is an excellent springboard for understanding the complex relationship of science, technology, and war in American history.

STAR 21 National Research Council,Division on Engineering and Physical Sciences,Commission on Engineering and Technical Systems,Board on Army Science and Technology,1992-02-01 Dramatic political and economic changes throughout the world, coupled with rapid advances in technology, pose an important question for the U.S. Army: What technologies are best suited to defending U.S. interests against tomorrow's military threats? *STAR 21* provides an expert analysis of how the Army can prepare itself for the battlefield of the future—where soldiers will wear smart helmets and combat chemical warfare with vaccines produced in days to counter new threats. This book summarizes emerging developments in robotics, brilliant munitions, medical support, laser sensors, biotechnology, novel materials, and other key areas. Taking into account reliability, deployability, and other values that all military systems will need, the volume identifies new systems and emerging technologies that offer the greatest payoff for the Army. The volume addresses a host of important military issues, including the importance of mobile, rapidly deployable forces, the changing role of the helicopter, and how commercial technology may help the Army stay ahead of potential opponents. *Alternative Selection*, Doubleday's Military Book Club

Military Enterprise and Technological Change Merritt Roe Smith,1985 In this book, historians of technology bring their special expertise to probing the influence of the military on technological development over a broad range of history and in a variety of cases.

Military Gadgets Nicholas D. Evans,2004 Coalition soldiers in the war in Iraq had access to the most extraordinary array of high-tech weapons ever created. 'Military Gadgets' introduces over 100 of today's most exciting and advanced military technologies.

The Evolution of Military Technology Gina Hagler,Linda R. Baker,2018-07-15 War has at some point touched every nation. Beginning with ancient history and following through to the present, this book addresses the question of why war exists, and explains the shapes in which it occurs. It will lead young readers on a journey through time by tracing weapons from the earliest stones and clubs to modern technological military warfare. Along with the evolution of weaponry through the ages, it also goes into the development of protective gear, transportation, communication, and military strategies.

Military Technology and Defense Manpower Martin Binkin,2010-12-01 When Virgil sang of arms and the man, words like smart and friendly characterized the warrior, not his weapons. Today, because of modern technology, these terms are more often used to describe the machine than the man. Dramatic advances have spawned a generation of weapon systems designed to tell friend from foe, to stalk the enemy with precision and stealth, and to destroy him with unprecedented efficiency. But can ordinary Americans operate and support these advanced systems, or have emerging technologies pushed military hardware beyond the capabilities of the people the armed forces can expect to attract and retain? How can the military

better match weapons and skills? Martin Binkin looks at the complex issues from several angles, starting with skill levels and jobs in today's military. He profiles America's arsenal in the 1990s and examines the implications of electronic warfare for manpower needs. Links among hardware complexity, reliability, and maintenance are unraveled, and current demographic trends traced. The study assesses various policy options available to hedge against the possibility that the military could become squeezed between growing demands for technologically adept people and a declining supply of recruits. Among these are efforts to design simpler systems with more reliable engineering techniques. Binkin reviews ways to make weapons easier to maintain, stressing component accessibility, technical documentation, and automated diagnostics. He covers the use of advanced technology to prepare people to handle new systems. Finally, he discusses the principal manpower management alternatives—expanding the role of women, substituting civilians, retaining more personnel, and returning to conscription.

Making the Soldier Decisive on Future Battlefields National Research Council, Division on Engineering and Physical Sciences, Board on Army Science and Technology, Committee on Making the Soldier Decisive on Future Battlefields, 2013-05-10 The U.S. military does not believe its soldiers, sailors, airmen, and marines should be engaged in combat with adversaries on a level playing field. Our combat individuals enter engagements to win. To that end, the United States has used its technical prowess and industrial capability to develop decisive weapons that overmatch those of potential enemies. In its current engagement—what has been identified as an era of persistent conflict—the nation's most important weapon is the dismounted soldier operating in small units. Today's soldier must be prepared to contend with both regular and irregular adversaries. Results in Iraq and Afghanistan show that, while the U.S. soldier is a formidable fighter, the contemporary suite of equipment and support does not afford the same high degree of overmatch capability exhibited by large weapons platforms—yet it is the soldier who ultimately will play the decisive role in restoring stability. *Making the Soldier Decisive on Future Battlefields* establishes the technical requirements for overmatch capability for dismounted soldiers operating individually or in small units. It prescribes technological and organizational capabilities needed to make the dismounted soldier a decisive weapon in a changing, uncertain, and complex future environment and provides the Army with 15 recommendations on how to focus its efforts to enable the soldier and tactical small unit (TSU) to achieve overmatch.

War Machines Timothy Moy, 2001 During the interwar years, from 1920 to 1940, leaders from the Army Air Corps and the Marine Corps recreated their agencies based on visions of new military technologies. In *War Machines*, Timothy Moy examines these recreations and explores how factors such as bureaucratic pressure, institutional culture, and America's technological enthusiasm shaped these leaders' choices. . . . The clarity of (Moy's) presentation and thesis make this book an easy and valuable experience.--*Journal of American History* This book's topic is particularly timely. *War Machines* offers insights about how institutional behavior molds technology selection that should be of value to today's strategists and force planners.--*Air Power History* Moy provides the student of American military history with a cogent, articulate, astute, scholarly, and compelling analysis that will prove a greatly appreciated contribution as both a personal study and an academic reference.--*The Midwest Book Review*

Army Science and Technology Analysis for Stabilization and Reconstruction Operations Richard Chait, 2006 In the area of stabilization and reconstruction (S & R) operations, this study examines capability gaps and science and technology (S & T) needs and concludes that some areas require renewed emphasis. The Deputy Assistant Secretary of the Army for Research and Technology has been seeking to strengthen the technology base and research planning of Army S & T programs as they relate to S & R operations. By identifying capability gaps and, where appropriate, applying technological approaches to addressing those gaps, the Army should be better positioned to meet its increasingly S & R-focused mission requirements. To support the Army in this effort, the Center for Technology and National Security Policy (CTNSP) at National Defense University (NDU) undertook a study to assess the technological capability gaps in the U.S. Army's ability to conduct S & R operations. The purpose of this study was threefold: (1)

through field surveys, interviews, and review of related studies, to identify the technological shortfalls most consistently cited in land force execution of phase IV operations; (2) with respect to these operations, to identify capability gaps and needs and assess them with specific focus on the issue of technology shortfalls; and (3) with the gap analysis in hand, to highlight technology opportunities for consideration by Army S & T leadership. This study is organized along 10 major categories of military capabilities: battle command, armored vehicles in urban environments, situational awareness (SA), intelligence, force protection, unmanned systems, nonlethal capabilities, information operations (IO), training and use of modeling and simulation, and logistics. Within each category, existing and forthcoming Army S & T programs are mapped against stated technology shortfalls and capability gaps. While the issues of technology shortfalls in military capabilities as a whole are important, the overriding orientation of this analysis is focused on S & R operations.

Commercial Multimedia Technologies for Twenty-First Century Army Battlefields National Research Council, Division on Engineering and Physical Sciences, Commission on Engineering and Technical Systems, Committee on Future Technologies for Army Multimedia Communications, 1995-11-27 This book responds to a request by the U.S. Army to study the applicability of commercial multimedia technologies to command, control, communications and intelligence needs on future battlefields. After reviewing Army's needs and discussing relevant commercial technologies within the context of a generic architecture, the book recommends approaches for meeting the Army's needs. Battlefield potential is illustrated, and drawing on lessons learned from the private sector a technology management strategy consisting of specific recommendations to the Army is provided. The key to future benefits is for the Army to accommodate the rapid changes taking place in the commercial world of multimedia technologies.

Technological Change and the Future of Warfare Michael E. O'Hanlon, 2011-04-01 In light of the spectacular performance of American high-technology weapons in the 1991 Persian Gulf War, as well as the phenomenal pace of innovation in the modern computer industry, many defense analysts have posited that we are on the threshold of a revolution in military affairs (RMA). The issue has more than semantic importance. Many RMA

proponents have begun to argue for major changes in Pentagon budgetary priorities and even in American foreign policy more generally to free up resources to pursue a transformed U.S. military—and to make sure that other countries do not take advantage of the purported RMA before we do. This book takes a more measured perspective. Beginning with a survey of various types of defense technologies, it argues that while important developments are indeed under way, most impressively in electronics and computer systems, the overall thrust of contemporary military innovation is probably not of a revolutionary magnitude. Some reorientation of U.S. defense dollars is appropriate, largely to improve homeland defense and to take advantage of the promise of modern electronics systems and precision-guided munitions. But radical shifts in U.S. security policy and Pentagon budget priorities appear unwarranted—especially if those shifts would come at the expense of American military engagement in overseas defense missions from Korea to Iraq to Bosnia.
