The Effects of Weight Loss and Exercise on 10-year and Lifetime Ascvd Risk Calculated Using the Pooled Cohort Equations
Tyler Desean Brown, 2022 BACKGROUND: Atherosclerotic Cardiovascular Disease (ASCVD) is the leading cause of morbidity and mortality in the United States. The American Heart Association (AHA) and American College of Cardiology (ACC) developed the Pooled Cohort Equations (PCE) to estimate 10-year and lifetime ASCVD risk. Exercise and hypocaloric diets reduce ASCVD risk scores by decreasing blood pressure and cholesterol. However, there are currently no data on the magnitude of change in ASCVD score from a lifestyle intervention. METHODS: twenty-four overweight and obese adults (Age: 46.5 ± 10.5 yrs.; Weight: 95.5 ± 12.7 kg; BMI: 34.4 ± 3.4 kg/m²) participated in 10 weeks of supervised aerobic exercise while participating in an OPTIFAST weight loss program to achieve clinically significant weight loss ([greater-than-or-equal-to]7% body weight). Body composition was measured using a whole-body DEXA scan. Cardiorespiratory fitness was measured using the modified balke protocol. The OPTIFAST program was ~800 kcals per day of total meal replacement consumed as shakes, bars, and soups. By week 8, participants increased their daily intake to 1300-1500 kcals and could replace two products with whole foods per day. Participants were also encouraged to attend weekly behavioral classes to assist with dietary compliance. The weekly aerobic exercise volume began at 300 MET min per week and increased by 50 MET min each week until 700 MET min each week was reached. 10-year and lifetime ASCVD risk scores were calculated using the PCE. RESULTS: At baseline, participants had a mean 10-year ASCVD risk of 3.0% and a mean lifetime risk of 32.8%. Following the intervention, there was a mean decrease in body weight (-8.4 kg, -9.9 %, p

Secondhand Smoke Exposure and Cardiovascular Effects

Institute of Medicine, Board on Population Health and Public Health Practice, Committee on Secondhand Smoke Exposure and Acute Coronary Events, 2010-02-21 Data suggest that exposure to secondhand smoke can result in heart disease in nonsmoking adults. Recently, progress has been made in reducing involuntary exposure to secondhand smoke through legislation banning smoking in workplaces, restaurants, and other public places. The effect of legislation to ban smoking and its effects on the cardiovascular health of nonsmoking adults, however, remains a question. *Secondhand Smoke Exposure and Cardiovascular Effects* reviews available scientific literature to assess the relationship between secondhand smoke exposure and acute coronary events. The authors, experts in secondhand smoke exposure and toxicology, clinical cardiology, epidemiology, and statistics, find that there is about a 25 to 30 percent increase in the risk of coronary heart disease from exposure to secondhand smoke. Their findings agree with the 2006 Surgeon General's Report conclusion that there are increased risks of coronary heart disease morbidity and mortality among men and women exposed to secondhand smoke. However, the authors note that the evidence for determining the magnitude of the relationship between chronic secondhand smoke exposure and coronary heart disease is not very strong. Public health professionals will rely upon *Secondhand*

Smoke Exposure and Cardiovascular Effects for its survey of critical epidemiological studies on the effects of smoking bans and evidence of links between secondhand smoke exposure and cardiovascular events, as well as its findings and recommendations.

Cardiovascular Diseases and Depression Bernhard T. Baune, Phillip J. Tully, 2016-08-01 The world is witnessing a burgeoning global epidemic of chronic cerebro- and cardiovascular disease and depression disorders. The reader will find this comprehensive book to be a long-needed, up-to-date knowledge base on these increasingly recognized comorbid conditions that have long-term consequences for individual function and well-being and society in general. This comprehensive book outlines the complex and bidirectional relationship between various types of depression and cerebro- and cardiovascular diseases. It is written by a range of experts in the field, including psychiatrists, cardiologists, neuroscientists, psychologists, and epidemiologists, with the aim of presenting and discussing the most recent evidence on the pathophysiology, neurobiology, and clinical presentation of these common and disabling comorbid conditions and the available pharmacological, psychological, and behavioral interventions. By elucidating the underlying clinical and neurobiological mechanisms in the brain and the rich interplay between the body and the brain biology, the book brings together the latest knowledge of this overlapping area in Psychiatry and Cardiology. The clear descriptions of evidence-based approaches to clinical treatment ensure that it will serve as both an up-to-date overview and a future guide for practicing clinicians and graduate students.

Includes a bioscience approach that focuses on inflammation and revisits the lipid hypothesis Presents the view that nutritional interventions have considerable value, not only for reducing cardiovascular risk for CVDs patients, but also acting as the best precaution for otherwise healthy people Advocates that nutritional habits that are formed at a young age are the best way to tackle the global epidemic that is CVDs
