Stroke-Vascular Diseases W.Wolfgang Fleischhacker,David J. Brooks,2013-12-01 Atherosclerosis, the underlying cause of heart attacks, strokes and peripheral vascular disease, is one of the major killers in the world. By 2020 WHO statistics indicate that it will be the most common cause of morbidity and mortality in both the industrialised world and the underdeveloped world. The disease develops slowly over many years in the innermost layer of large and medium-sized arteries (Fig. 1) (Scott, 1995; Ross, 1999; Naumova and Scott, 2000; Glass and Witztum, 2001; Libby, 2001). It does not usually become manifest before the fourth or fifth decade, but then often strikes with devastating suddenness. Fifty per cent of individuals still die (25 per cent immediately) from their first heart attack; and morbidity from coronary heart disease and stroke is very significant. The disease has a profound impact on health care services and on industrial economies. The lesions of atherosclerosis Autopsy studies show that in humans atherosclerosis begins in the first and second decade of life. A similar disease can be produced in experimental animals, where diet and genetics can be manipulated to produce identical lesions. The earliest lesions are fatty streaks. These consist of an accumulation of lipid-engorged macrophages (foam cells) and T and B lymphocytes in the arterial intima. With time, the fatty streaks progress to intermediate lesions, composed of foam cells and smooth muscle cells.

Primary Care Nutrition David Heber,Zhaoping Li,2017-07-14 This book contains the necessary knowledge and tools to incorporate nutrition into primary care practice. As a practical matter, this effort is led by a dedicated primary care physician with the help of motivated registered dietitians, nurses, psychologists, physical therapists, and office staff whether within a known practice or by referral to the community. It is essential that the nutrition prescription provided by the physician be as efficient as possible. While many team members have superior knowledge in the areas of nutrition, exercise, and psychology, the health practitioner remains the focus of patient confidence in a therapy plan. Therefore, the endorsement of the plan rather than the implementation of the plan is the most important task of the physician. This book proposes a significant change in attitude of primary health care providers in terms of the power of nutrition in prevention and treatment of common disease. It features detailed and referenced information on the role of nutrition in the most common conditions encountered in primary care practice. In the past, treatment focused primarily on drugs and surgery for the treatment of disease with nutrition as an afterthought. Advanced technologies and drugs are effective for the treatment of acute disease, but many of the most common diseases such as heart disease, diabetes, and cancer are not preventable with drugs and surgery. While there is mention of prevention of heart disease, this largely relates to the use of statins with some modest discussion of a healthy diet. Similarly, prevention of type 2 diabetes is the early introduction of metformin or intensive insulin therapy.

Illustrative case examples and practical practice points help each chapter come alive. A special chapter on communication differences between men and women assists clinicians in their conversations with patients. This book fills an important need by applying years of research findings to sex and gender specific medical care and demonstrating that an individualized approach to patient care will lead to improved detection, treatment and prevention of disease. Explores the effects of sex and gender on disease presentation, treatment and prognosis, and how these differences influence clinical decision-making Provides practical guidance that helps clinicians implement a more individualized approach to patient care Contains information on diseases in each major specialty, as well as chapters on communication, pharmacology and public health challenges
