Mergers, Acquisitions, and Other Restructuring Activities Donald DePamphilis,2017-07-12
Mergers, Acquisitions, and Other Restructuring Activities: An Integrated Approach to Process, Tools, Cases, and Solutions, Ninth Edition, is the most current, comprehensive and cutting-edge text on M&A and corporate restructuring available. It includes many of the most up-to-date and notable deals and precedent setting judicial decisions, as well as new regulations, trends and tactics employed in M&As. The implications of recent developments such as negative interest rates on valuation and the backlash against globalization for cross-border M&As are discussed. More than 90% of the case studies are new for this edition, involving deals either announced or completed during the last several years. It is comprehensive in that nearly all aspects of M&As and corporate restructuring are explored from business plan development to target selection and valuation to negotiation and post-merger integration. It is cutting edge in that conclusions and insights are anchored by the most recent academic research, with references to more than 160 empirical studies published in leading peer-reviewed journals just since the release of the last edition in 2015. Teaches about the financial, legal, accounting and strategic elements of mergers and acquisitions by concentrating on the ways their agents interact Emphasizes current events and trends through new and updated cases Highlights international mergers and acquisitions activities

Nonlinearity in Living Systems: Theoretical and Practical Perspectives on Metrics of Physiological Signal Complexity Sladjana Spasić, Srdjan Kesić, 2019-06-28 The biological basis of physiological signals is incredibly complex. While many types of research certainly appreciate molecular, cellular and systems approach to unravel overall biological complexity, in the recent decades the interest for mathematical and computational characterization of structural and functional basis underlying biological phenomena gain wide popularity among scientists. Nowadays, we witnessed wide range applications of nonlinear quantitative analysis that produced measures such as fractal dimension, power-law scaling, Hurst exponent, Lyapunov exponent, approximate entropy, sample entropy, Lempel-Ziv complexity, as well as other metrics for predictions of onset and progression of many pathological conditions, especially in the central nervous systems (CNS). In this Research Topic, we seek to bring together the recent practical and theoretical advances in the development and application of nonlinear methods or narrower fractal-based methods for characterizing the complex physiological systems at multiple levels of the organization. We will discuss the use of various complexity measures and appropriate parameters for characterizing the variety of physiological signals up to the systems level. There are multiple aims in this topic. The recent advancement in the application of nonlinear methods for both normal and pathological physiological conditions is the first. The second aim is to emphasize the more recent successful attempt to apply these methods across animal species. Finally, a comprehensive understanding of advantages and disadvantages of each method, especially between its mathematical assumptions and real-world applicability, can help to find out what is at stake regarding the above aims and to direct us toward the more fruitful application of nonlinear measures and statistics in physiology and biology in general.
