Internet Teletraffic Modeling and Estimation Alexandre Barbosa de Lima,Jose Roberto de Almeida Amazonas,2013-01-31 Network traffic has fractal properties such as impulsiveness, self-similarity, and long-range dependence over several time scales from milliseconds to minutes. These features have motivated the development of new traffic models and traffic control algorithms. Internet Teletraffic Modeling and Estimation presents a new statespace model for Internet traffic, which is based on a finite-dimensional representation of the Autoregressive Fractionally Integrated Moving Average (ARFIMA) random process. This book also investigates the modeling via Autoregressive (AR) processes.

Advanced Sampling Methods Raosaheb Latpate,Jayant Kshirsagar,Vinod Kumar Gupta,Girish Chandra,2021-05-07 This book discusses all major topics on survey sampling and estimation. It covers traditional as well as advanced sampling methods related to the spatial populations. The book presents real-world applications of major sampling methods and illustrates them with the R software. As a large sample size is not cost-efficient, this book introduces a new method by using the domain knowledge of the negative correlation between the variable of interest and the auxiliary variable in order to control the size of a sample. In addition, the book focuses on adaptive cluster sampling, rank-set sampling and their applications in real life. Advance methods discussed in the book have tremendous applications in ecology, environmental science, health science, forestry, bio-sciences, and humanities. This book is targeted as a text for undergraduate and graduate students of statistics, as well as researchers in various disciplines.

The first textbook that systematically extends traditional sampling theory with the aid of a modern model assisted outlook. Covers classical topics as well as areas where significant new developments have taken place.

Applied State Estimation and Association Chaw-Bing Chang,Keh-Ping Dunn,2023-08-15 A rigorous introduction to the theory and applications of state estimation and association, an important area in aerospace, electronics, and defense industries. Applied state estimation and association is an important area for practicing engineers in aerospace, electronics, and defense industries, used in such tasks as signal processing, tracking, and navigation. This book offers a rigorous introduction to both theory and application of state estimation and association. It takes a unified approach to problem formulation and solution development that helps students and junior engineers build a sound theoretical foundation for their work and develop skills and tools for practical applications. Chapters 1 through 6 focus on solving the problem of estimation with a single sensor

observing a single object, and cover such topics as parameter estimation, state estimation for linear and nonlinear systems, and multiple model estimation algorithms. Chapters 7 through 10 expand the discussion to consider multiple sensors and multiple objects. The book can be used in a first-year graduate course in control or system engineering or as a reference for professionals. Each chapter ends with problems that will help readers to develop derivation skills that can be applied to new problems and to build computer models that offer a useful set of tools for problem solving. Readers must be familiar with state-variable representation of systems and basic probability theory including random and stochastic processes.

Cross-Modal Learning: Adaptivity, Prediction and Interaction Jianwei Zhang,Stefan Wermter,Fuchun Sun,Changshui Zhang,Andreas K. Engel,Brigitte Röder,Xiaolan Fu,Gui Xue,2023-02-02 The purpose of this Research Topic is to reflect and discuss links between neuroscience, psychology, computer science and robotics with regards to the topic of cross-modal learning which has, in recent years, emerged as a new area of interdisciplinary research. The term cross-modal learning refers to the synergistic synthesis of information from multiple sensory modalities such that the learning that occurs within any individual sensory modality can be enhanced with information from one or more other modalities. Cross-modal learning is a crucial component of adaptive behavior in a continuously changing world, and examples are ubiquitous, such as: learning to grasp and manipulate objects; learning to walk; learning to read and write; learning to understand language and its referents; etc. In all these examples, visual, auditory, somatosensory or other modalities have to be integrated, and learning must be cross-modal. In fact, the broad range of acquired human skills are cross-modal, and many of the most advanced human capabilities, such as those involved in social cognition, require learning from the richest combinations of cross-modal information. In contrast, even the very best systems in Artificial Intelligence (AI) and robotics have taken only tiny steps in this direction. Building a system that composes a global perspective from multiple distinct sources, types of data, and sensory modalities is a grand challenge of AI, yet it is specific enough that it can be studied quite rigorously and in such detail that the prospect for deep insights into these mechanisms is quite plausible in the near term. Cross-modal learning is a broad, interdisciplinary topic that has not yet coalesced into a single, unified field. Instead, there are many separate fields, each tackling the concerns of cross-modal learning from its own perspective, with currently little overlap. We anticipate an accelerating trend towards integration of these areas and we intend to contribute to that integration. By focusing on cross-modal learning, the proposed Research Topic can bring together recent progress in artificial intelligence, robotics, psychology and neuroscience.

Asset Pricing T. Kariya,Regina Liu,2011-06-27 1. Main Goals The theory of asset pricing has grown markedly more sophisticated in the last two decades, with the application of powerful mathematical tools such as probability theory, stochastic processes and numerical analysis. The main goal of this book is to provide a systematic exposition, with practical applications, of the no-arbitrage theory for asset pricing in financial engineering in the framework of a discrete time approach. The book should also serve well as a textbook on financial asset pricing. It should be accessible to a broad audience, in particular to practitioners in financial and related industries, as well as to students in MBA or graduate/advanced undergraduate programs in finance, financial engineering, financial econometrics, or financial information science. The no-arbitrage asset pricing theory is based on the simple and well accepted principle that financial asset prices are instantly adjusted at each moment in time in order not to allow an arbitrage opportunity. Here an arbitrage opportunity is an opportunity to have a portfolio of value at an initial time lead to a positive terminal value with probability 1 (equivalently, at no risk), with money neither added nor subtracted from the portfolio in rebalancing during the investment period. It is necessary for a portfolio of value to include a short-sell position as well as a long-buy position of some assets.

Asymptotic Theory of Nonlinear Regression A.A. Ivanov,2013-04-17 Let us assume that an observation X_i is a random variable (r.v.) with values in \mathbb{R}^1 and distribution P_i (\mathbb{R}^1 is the real line, and \mathcal{B} is the σ -algebra of its Borel subsets). Let us also assume that the unknown distribution P_i belongs to a certain parametric family $\{P_i(\theta), \theta \in \Theta\}$. We call the triple $\xi_i = \{\mathbb{R}^1, \mathcal{B}, P_i(\theta), \theta \in \Theta\}$ a statistical experiment generated by the observation X_i . We shall say that a statistical experiment $\xi_n = \{\mathbb{R}^n, \mathcal{B}, P; \theta \in \Theta\}$ is the product of the statistical experiments $\xi_i, i = 1, \dots, n$ if $P' = P(\theta) \times \dots \times P(\theta)$ (\mathbb{R}^n is the n -dimensional Euclidean space, and \mathcal{B} is the σ -algebra of its Borel subsets). In this manner the experiment ξ_n is generated by n independent observations $X = (X_1, \dots, X_n)$. In this book we study the statistical experiments ξ_n generated by observations of the form $j = 1, \dots, n, (0.1) X_j = g(j, \omega) + c_j, c_j \in \mathbb{R}$ In (0.1) $g(j, \omega)$ is a non-random function defined on Ω , where Ω is the closure in \mathbb{R}^q of the open set $\omega \in \mathbb{R}^q$, and C_j are independent r. v. -s with common distribution function $(d_j) P$ not depending on (θ) .

Theory of Sample Surveys with R Andreas Behr,2015-03-11 Das englischsprachige Buch vermittelt Kenntnisse der wichtigsten Methoden der modernen design-basierten Stichprobentheorie. Alle Methoden werden mit Hilfe von numerischen Beispielen illustriert und deren Umsetzung mit Hilfe der statistischen Software R dargestellt. Zahlreiche empirische Beispiele und Simulationen helfen, die Eigenschaften von Schätzfunktionen zu beurteilen. This textbook provides an up-to-date treatment of modern design based theory of survey sampling. All methods are illustrated with numerical examples and applied using the statistical software R. Numerous empirical examples and simulations provide insights into the properties of estimation functions.

The Econometrics of Panel Data László Mátyás,Patrick Sevestre,2013-12-01 The aim of this volume is to provide a general overview of the econometrics of panel data, both from a theoretical and from an applied viewpoint. Since the pioneering papers by Edwin Kuh (1959), Yair Mundlak (1961), Irving Hoch (1962), and Pietro Balestra and Marc Nerlove (1966), the pooling of cross sections and time series data has become an increasingly popular way of quantifying economic relationships. Each series provides information lacking in the other, so a combination of both leads to more accurate and reliable results than would be achievable by one type of series alone. Over the last 30 years much work has been done: investigation of the properties of the applied estimators and test statistics, analysis of dynamic models and the effects of eventual measurement errors, etc. These are just some of the problems addressed by this work. In addition, some specific difficulties associated with the use of panel data, such as attrition, heterogeneity, selectivity bias, pseudo panels etc., have also been explored. The first objective of this book, which takes up Parts I and II, is to give as complete and up-to-date a presentation of these theoretical developments as possible. Part I is concerned with classical linear models and their extensions; Part II deals with nonlinear models and related issues: logit and probit models, latent variable models, duration and count data models, incomplete panels and selectivity bias, point processes, and simulation techniques.
