*Strategic Intelligence for the Future 2* Henri Dou, Alain Juillet, Philippe Clerc, 2019-04-10 Information in all its forms is at the heart of the economic intelligence process. It is also a powerful vector of innovation and, more than ever, a balance between economic and societal forces. That is why a large part of *Strategic Intelligence for the Future 2* analyzes the various aspects of information, from traditional processing and research to the psychological and epigenetic aspects of its development. This leads to a new vision of its integration into organizations. In addition, new technologies offer extensive access to information, including social networks which are critically analyzed here. In a complex world where geopolitics and the new concept of information warfare are becoming increasingly important, it becomes imperative to better apprehend and understand our environment, in order to develop critical thinking that will reinforce the different global aspects of security in economic intelligence.

Cohesive Subgraph Search Over Large Heterogeneous Information Networks Yixiang Fang, Kai Wang, Xuemin Lin, Wenjie Zhang, 2022-05-06 This SpringerBrief provides the first systematic review of the existing works of cohesive subgraph search (CSS) over large heterogeneous information networks (HINs). It also covers the research breakthroughs of this area, including models, algorithms and comparison studies in recent years. This SpringerBrief offers a list of promising future research directions of performing CSS over large HINs. The authors first classify the existing works of CSS over HINs according to the classic cohesiveness metrics such as core, truss, clique, connectivity, density, etc., and then extensively review the specific models and their corresponding search solutions in each group. Note that since the bipartite network is a special case of HINs, all the models developed for general HINs can be directly applied to

bipartite networks, but the models customized for bipartite networks may not be easily extended for other general HINs due to their restricted settings. The authors also analyze and compare these cohesive subgraph models (CSMs) and solutions systematically. Specifically, the authors compare different groups of CSMs and analyze both their similarities and differences, from multiple perspectives such as cohesiveness constraints, shared properties, and computational efficiency. Then, for the CSMs in each group, the authors further analyze and compare their model properties and high-level algorithm ideas. This SpringerBrief targets researchers, professors, engineers and graduate students, who are working in the areas of graph data management and graph mining. Undergraduate students who are majoring in computer science, databases, data and knowledge engineering, and data science will also want to read this SpringerBrief.

Algorithms for Big Data Hannah Bast, Claudius Korzen, Ulrich Meyer, Manuel Penschuck, 2022 This open access book surveys the progress in addressing selected challenges related to the growth of big data in combination with increasingly complicated hardware. It emerged from a research program established by the German Research Foundation (DFG) as priority program SPP 1736 on Algorithmics for Big Data where researchers from theoretical computer science worked together with application experts in order to tackle problems in domains such as networking, genomics research, and information retrieval. Such domains are unthinkable without substantial hardware and software support, and these systems acquire, process, exchange, and store data at an exponential rate. The chapters of this volume summarize the results of projects realized within the program and survey-related work. This is an open access book.
