Patent Law for Computer Scientists Daniel Closa,Alex Gardiner,Falk Giemsa,Jörg Machek,2010-02-03 Patent laws are different in many countries, and inventors are sometimes at a loss to understand which basic requirements should be satisfied if an invention is to be granted a patent. This is particularly true for inventions implemented on a computer. While roughly a third of all applications (and granted patents) relate, in one way or another, to a computer, applications where the innovation mainly resides in software or in a business method are treated differently by the major patent offices in the US (USPTO), Japan (JPO), and Europe (EPO). The authors start with a thorough introduction into patent laws and practices, as well as in related intellectual property rights, which also explains the procedures at the USPTO, JPO and EPO and, in particular, the peculiarities in the treatment of applications centering on software or computers. Based on this theoretical description, next they present in a very structured way a huge set of case studies from different areas like business methods, databases, graphical user interfaces,

digital rights management, and many more. Each set starts with a rather short description and claim of the invention, then explains the arguments a legal examiner will probably have, and eventually refines the description step by step, until all the reservations are resolved. All of these case studies are based on real-world examples, and will thus give an inexperienced developer an idea about the required level of detail and description he will have to provide. Together, Closa, Gardiner, Giemsa and Machek have more than 70 years experience in the patent business. With their academic background in physics, electronic engineering, and computer science, they know about both the legal and the subject-based subtleties of computer-based inventions. With this book, they provide a guide to a patent examiner's way of thinking in a clear and systematic manner, helping to prepare the first steps towards a successful patent application.

Minitel Julien Mailland,Kevin Driscoll,2017-06-30 The first scholarly book in English on Minitel, the pioneering French computer network, offers a history of a technical system and a cultural phenomenon. A decade before the

Internet became a medium for the masses in the United States, tens of millions of users in France had access to a network for e-mail, e-commerce, chat, research, game playing, blogging, and even an early form of online porn. In 1983, the French government rolled out Minitel, a computer network that achieved widespread adoption in just a few years as the government distributed free terminals to every French telephone subscriber. With this volume, Julien Mailland and Kevin Driscoll offer the first scholarly book in English on Minitel, examining it as both a technical system and a cultural phenomenon. Mailland and Driscoll argue that Minitel was a technical marvel, a commercial success, and an ambitious social experiment. Other early networks may have introduced protocols and software standards that continue to be used today, but Minitel foretold the social effects of widespread telecomputing. They examine the unique balance of forces that enabled the growth of Minitel: public and private, open and closed, centralized and decentralized. Mailland and Driscoll describe Minitel's key technological components, novel online services, and thriving virtual communities. Despite the seemingly tight grip of the state, however, a lively Minitel culture emerged, characterized by spontaneity, imagination, and creativity. After three decades of continuous service, Minitel was shut down in 2012, but the history of Minitel should continue to inform our thinking about Internet policy, today and into the future.

Satellite Regulation in Europe Stéphan Le Goueff,2021-10-25 Commercial satellite activities have undergone enormous growth in the last decades, and so has the complexity of the legal framework within which these activities have to be carried out. Because of the international character of satellite activities, this legal framework has often been established on an international or regional level, through institutions such as the European Union, the International Telecommunications Union, the World Trade Organisation and the European Conference of Postal and Telecommunications Administrations. It is not an easy task to obtain a complete picture of this legal framework. For this reason, it was considered opportune to assemble all relevant legal texts and materials established by these institutions into one book. As telecommunications is currently the most important commercial application of satellites, it should come as no surprise to anyone that the main part of the book is dedicated to this application, simply because of the fact that the legal framework is furthest developed. However, relevant texts and materials for the three other commercial satellite activities - broadcasting, remote sensing and navigation - have also been included. This book is a very valuable tool for all those involved in the European satellite business or for those who want to get involved in it, whether they are lawyers or non-lawyers; everyone is affected by the laws and

regulations governing this field and everyone should be aware of the limitations these laws and regulations might impose.
