On-Camera Flash ,2015-10-19 Photographers are always looking for perfect light. Unfortunately, the quality of available light, and the situations in which photos are created, are rarely perfect. This is especially true when photographing weddings or portraits on location. So while finding beautiful existing light is every photographer's ideal, it isn't always possible. This is the point at which photographers tend to reach for a portable, on-camera flash. Indeed, these intense light sources can prove invaluable, but only if you know how to use them effectively. In the hands of an inexperienced photographer, on-camera flash will produce images that look flat and lifeless—images with harsh shadows, washed-out skin tones, cavernous black backgrounds, and other unappealing visual characteristics. In this book, acclaimed wedding and portrait photographer Neil van Niekerk shows you how to avoid the pitfalls photographers new to speedlights often encounter so that you can produce professional images using on-camera flash. You'll learn to use simple accessories to manipulate the quality of light from your flash and how to improve a lighting scenario by enhancing rather than overwhelming the existing light. When the available light is too low and too uneven to be combined with flash, he shows you how to override it completely with flash and, with some thought and careful application of specialized techniques, still get results that look great. On-camera flash is one of the most challenging light sources to master, but with the techniques in this book you'll learn to use it with confidence. For wedding and environmental portrait photographers who must work in ever-changing lighting scenarios, this can mean better images and better sales.

Neural Computation, Neural Devices, and Neural Prosthesis Zhi Yang,2014-04-15 In the past decades, interdisciplinary investigations overlapping biology, medicine, information science, and engineering have formed a very exciting and active field that attracts scientists, medical doctors, and engineers with knowledge in different domains. A few examples of such investigations include neural prosthetic implants that aim to improve the quality of life for patients suffering from neurologic disease and injury; brain machine interfaces that sense, analyze, and translate electrical signals from the brain to build closed-loop, biofeedback systems; and fundamental studies of intelligence, cognitive functions, and psychological behaviors correlated to their neurological basis. Although this interdisciplinary area is still in its infancy, it can potentially create some of the most significant impact: treating diseases that are considered untreatable, interpretation and communication of neuron ensembles, or even a revolutionary perception and understanding of life different from philosophical or immaterial approaches. Fortunately, several academic societies recognize the value and impact of this growing field, firmly supporting related research. Such support will drive a booming future in the next twenty or thirty years. Research in this area is frequently project-driven, and the generated knowledge has been scattered in different fields of neuroscience, computation, material and technology, circuits and system, clinical reports, and psychology—the scope considerably across the boundary of traditionally defined disciplines. Neural Computation, Neural Devices, and Neural Prosthesis is intended to assemble such knowledge, from there suggesting a systematic approach guiding future educational and research activities. The targeted audience includes both students and researchers.

Technologies of Vision Steve F Anderson,2017-10-20 An investigation of the computational turn in visual culture, centered on the entangled politics and pleasures of data and images. If the twentieth century was tyrannized by images, then the twenty-first is ruled by data. In *Technologies of Vision*, Steve Anderson argues that visual culture and the methods developed to study it have much to teach us about today's digital culture; but first we must examine the historically entangled relationship between data and images. Anderson starts from the supposition that there is no great divide separating pre- and post-digital culture. Rather than creating an insular field of new and inaccessible discourse, he argues, it is more productive to imagine that studying “the digital” is coextensive with critical models—especially the politics of seeing and knowing—developed for understanding “the visual.” Anderson's investigation takes on an eclectic array of examples ranging from virtual reality, culture analytics, and software art to technologies for computer vision, face recognition, and photogrammetry. Mixing media archaeology with software studies, Anderson mines the history of technology for insight into both the politics of data and the pleasures of algorithms. He proposes a taxonomy of modes that describe the functional relationship between data and images in the domains of space, surveillance and data visualization. At stake in all three are tensions between the totalizing logic of data and the unruly chaos of images.

Human-Computer Systems Interaction Zdzislaw S. Hippe, Juliusz Lech Kulikowski, 2009-10-13 For the last decades, as the computer technology has been developing, the importance of human-computer systems interaction problems was growing. This is not only because the computer systems performance characteristics have been improved but also due to the growing number of computer users and of their expectations about general computer systems capabilities as universal tools for human work and life facilitation. The early technological problems of man-computer information exchange - which led to a progress in computer programming languages and input/output devices construction - have been step by step dominated by the more general ones of human interaction with-and-through computer systems, shortly denoted as H-C SI problems. The interest of scientists and of any sort specialists to the H-C SI problems is very high as it follows from an increasing number of scientific conferences and publications devoted to these topics. The present book contains selected papers concerning various aspects of H-C SI. They have been grouped into five Parts: I. General H-C SI problems (7 papers), II. Disabled persons helping and medical H-C SI applications (9 papers), III. Psychological and linguistic H-C SI aspects (9 papers), IV. Robots and training systems (8 papers), V. Various H-C SI applications (11 papers).
