Malcolm Gladwell

**Blink** Malcolm Gladwell, 2007-04-03 From the #1 bestselling author of *The Bomber Mafia*, the landmark book that has revolutionized the way we understand leadership and decision making. In his breakthrough bestseller *The Tipping Point*, Malcolm Gladwell redefined how we understand the world around us. Now, in *Blink*, he revolutionizes the way we understand the world within. *Blink* is a book about how we think without thinking, about choices that seem to be made in an instant--in the blink of an eye--that actually aren't as simple as they seem. Why are some people brilliant decision makers, while others are consistently inept? Why do some people follow their instincts and win, while others end up stumbling into error? How do our brains really work--in the office, in the classroom, in the kitchen, and in the bedroom? And why are the best decisions often those that are impossible to explain to others? In *Blink* we meet the psychologist who has learned to predict whether a marriage will last, based on a few minutes of observing a couple; the tennis coach who knows when a player will double-fault before the racket even makes contact with the ball; the antiquities experts who recognize a fake at a glance. Here, too, are great failures of blink: the election of Warren Harding; New Coke; and the shooting of Amadou Diallo by police. *Blink* reveals that great decision makers aren't those who process the most information or spend the most time deliberating, but those who have perfected the art of thin-slicing--filtering the very few factors that matter from an overwhelming number of variables.

**You Blink Twelve Times a Minute** Barbara Seuling, 2008-11-27 Since your brain cells are the only cells in your body that are not replaced, you better keep them healthy. From strange ailments, hiccups, and snoring to medical marvels, this book puts a body of facts at your fingertips. It's time to put your feet up and exercise your brain!

Flicker Professor Jeffrey Zacks, 2014-11-03 How is it that a patch of flickering light on a wall can produce experiences that engage our imaginations and can feel totally real? From the vertigo of a skydive to the emotional charge of an unexpected victory or defeat, movies give us some of our most vivid experiences and most lasting memories. They reshape our emotions and worldviews--but why? In *Flicker*, Jeff Zacks delves into the history of cinema and the latest research to explain what happens between your ears when you sit down in the theatre and the lights go out. Some of the questions *Flicker* answers: Why do we flinch when Rocky takes a punch in Sylvester Stallone's movies, duck when the jet careens towards the tower in *Airplane*, and tap our toes to the dance numbers in *Chicago* or *Moulin Rouge*? Why do so many of us cry at the movies? What's the difference between remembering what happened in a movie and what happened in real life--and can we always tell the difference? To answer these questions and more, *Flicker* gives us an engaging, fast-paced look at what happens in your head when you watch a movie.

*Don't Blink* Brandon Buell, Brittany Buell, 2016-09-06 Not long into their pregnancy, Brandon and Brittany Buell were given the heartbreaking news that their son, whom they had already named Jaxon, had a rare condition called Microhydranencephaly (meaning that he was missing part of his skull and most of his brain), and that he would likely die in utero or shortly after birth. If he did somehow survive, they were told he would suffer from severe neurological problems, would likely be deaf, blind, and unable to sit up, crawl, or communicate. Terminating the pregnancy was suggested on numerous occasions, but the Buells refused, opting instead to "choose life." In *Don't Blink*, Brandon and Brittany share the invaluable lessons that Jaxon—now approaching two—has taught them about the inherent value of every human life, the extraordinary power of faith, and the key to living each and every day to the fullest.

**Encyclopedia of the Mind** Harold Pashler, 2013-01-14 It's hard to conceive of a topic of more broad and personal interest than the study of the mind. In addition to its traditional investigation by the disciplines of psychology, psychiatry, and neuroscience, the mind has also been a focus of study in the fields of philosophy, economics, anthropology, linguistics, computer science, molecular biology, education, and literature. In all these approaches, there is an almost universal fascination with how the mind works and how it affects our lives and our behavior. Studies of the mind and

brain have crossed many exciting thresholds in recent years, and the study of mind now represents a thoroughly cross-disciplinary effort. Researchers from a wide range of disciplines seek answers to such questions as: What is mind? How does it operate? What is consciousness? This encyclopedia brings together scholars from the entire range of mind-related academic disciplines from across the arts and humanities, social sciences, life sciences, and computer science and engineering to explore the multidimensional nature of the human mind.

*Converging Clinical and Engineering Research on Neurorehabilitation* José L Pons, Diego Torricelli, Marta Pajaro, 2013-02-19 Restoring human motor and cognitive function has been a fascinating research area during the last century. Interfacing the human nervous system with electro-mechanical rehabilitation machines is facing its crucial passage from research to clinical practice, enhancing the potentiality of therapists, clinicians and researchers to rehabilitate, diagnose and generate knowledge. The 2012 International Conference on Neurorehabilitation (ICNR2012) brings together researchers and students from the fields of Clinical Rehabilitation, Applied Neurophysiology and Biomedical Engineering, covering a wide range of research topics: · Clinical Impact of Technology · Brain-Computer Interface in Rehabilitation · Neuromotor & Neurosensory modeling and processing · Biomechanics in Rehabilitation · Neural Prostheses in Rehabilitation · Neuro-Robotics in Rehabilitation · Neuromodulation This Proceedings book includes general contributions (2-page extended abstracts) from oral and poster sessions, as well as from special sessions. A section is also dedicated to pre-post conference workshops, including invited contributions from internationally recognized researchers. A selection of most relevant papers have been considered for publication in international journals (e.g. JNER, JACCES, ...), therefore they will appear soon in their extended versions in Special Issues. These Proceedings also contain brief descriptions of keynote lectures from invited world-class professors, and a number of thematic round tables covering technological and institutional issues.

**In the Blink of an Eye** Peter Coghlan,Ivan Longland,2013 As a soldier, Peter Coghlan faced bombs, bullying, murderous mobs and Hodgkins Lymphoma, the aggressive cancer which ended his military career. But after moving to Perth, Australia with Jade, the love of his life, there was no time to dwell on the past as Peter enjoyed a pre-dinner drink on the patio with friends and family. The future on that hot, sunny evening seemed as bright as the weather until, suddenly and shockingly, his dreams were shattered by a massive brain stem stroke. A frantic dash to hospital and emergency surgery rushed by in a blur and it was only when Peter awoke from a coma that he realised the awful truth. The stroke had left him virtually paralysed, imprisoned in his own body. At least he could blink. Using an alphabet board to communicate, he spelled out his determination to get back everything he'd lost. This true life account of one man's fight against Locked-In Syndrome (LIS) is in turn heart-breaking, hilarious, harrowing and occasionally shocking. Yet, thanks to Peter's amazing courage, *In the Blink of an Eye* is never less than inspirational as he faces his greatest battle of all.

**The Emotional Life of Your Brain** Richard J. Davidson,2012-03-01 This longawaited book by a pioneer in brain research offers a new model of our emotions- their origins, their power, and their malleability. For more than thirty years, Richard Davidson has been at the forefront of brain research. Now he gives us an entirely new model for understanding our emotions, as well as practical strategies we can use to change them. Davidson has discovered that personality is composed of six basic emotional styles, including resilience, self-awareness, and attention. Our emotional fingerprint results from where on the continuum of each style we fall. He explains the brain chemistry that underlies each style in order to give us a new model of the emotional brain, one that will even go so far as to affect the way we treat conditions like autism and depression. And, finally, he provides strategies we can use to change our own brains and emotions-if that is what we want to do. Written with bestselling author Sharon Begley, this original and exciting book gives us a new and useful way to look at ourselves, develop a sense of well-being, and live more meaningful lives.

*Brain-Computer Interfaces* Aboul Ella Hassanien,Ahmad Taher Azar,2014-11-01 The success of a BCI system depends as much on the system itself as on the user's ability to produce distinctive EEG activity. BCI systems can be divided into two groups according to the placement of the electrodes used to detect and measure neurons firing in the brain. These groups are: invasive systems, electrodes are inserted directly into the cortex are used for single cell or multi unit recording, and electrocorticography (EcoG), electrodes are placed on the surface of the cortex (or dura); noninvasive systems, they are placed on the scalp and use electroencephalography (EEG) or magnetoencephalography (MEG) to detect neuron activity. The book is basically divided into three parts. The first part of the book covers the basic concepts and overviews of Brain Computer Interface. The second part describes new theoretical developments of BCI systems. The third part covers views on real applications of BCI systems.

**Perfect Eyesight** Robert A. Zuraw,Robert T. Lewanski,2010-06 The Miracle of Perfect Eyesight The Truth About The Eyes It is said that the eyes are the windows of the soul. How clear is your vision? Can you see the world without blurry vision or distortion? The so-called normal eye can easily read the 20 foot line on the Snellen Eye Test Chart at 20 feet away--this is called 20-20 vision. There is no limit as to how much one can improve their

vision beyond the 20-20 range. Healthy eyes are a marvel of nature's creation. A person with above average eyesight can easily read the 10 foot line (smallest bottom line on the Snellen Eye Test Chart), at 20 feet away--20-10 vision! I have seen people who can read the 10 foot line at 50 to 60 feet away--60-10 vision. This is called telescopic vision. There is also no limit to reading small Microscopic Type Print--known as microscopical vision. There is no limit to how sharp and clear one can see in the distance and close-up. We are all walking, talking, seeing miracles of Great Nature. The sages say human beings are solidified sunlight, or trails of light, because our eyesight and our very life is totally dependent on the Solar Orb! We would all become blind without the healing rays of sunlight upon our retina. Sunlight also gives us natural Vitamin D for healthy skin and eyes. The eye training secrets contained in this book have taken me from 20-600 (progressive advanced myopia, or blind without glasses), to better than 20-20 vision. If you practice and are persistent in your eye training, you too can improve vision quickly. Eye Muscles Accommodation: The Mystery Unveiled In order to see properly, the eyes must accommodate. Accommodation takes place when focusing on various distances--close and far. Which muscles are doing the focusing during accommodation is debatable among Ophthalmologists. Dr. Helmholtz, an early eye doctor, found that only the ciliary eye muscles do the accommodating. The Helmholtz Theory is the accepted belief of most modern eyeglass doctors. Dr. Bates, a natural eye specialist, felt that the two oblique eye muscles performed eye accommodation by compressing the round eyeball in the middle and making it longer horizontally. Dr. Bates cut these muscles in rabbits and found the eyes could not accommodate. When he injected a drug to paralyze the oblique muscles, the eyes failed to accommodate. When he put together the severed muscles and washed out the drug, the rabbit's eyes were able to accommodate again. The Helmholtz theory holds that accommodation is due to the expansion and contraction of the crystalline lens, caused by the action of the ciliary muscle. Dr. Bates, through his experiments, discovered and proved that it is not the crystalline lens but the six external muscles that act upon the eyeball and give the eye its ability to adjust and accommodate to near and far objects. The fact that patients who have had the crystalline lens removed are still able to see, and have the power to accommodate, should be convincing proof of this theory. It is obvious both the oblique muscles and the ciliary muscles work in conjunction when focusing. Here is the reason why--the normal eye when looking at a distant object becomes shortened, and when looking at a close object is elongated. The external muscles--oblique, recti, iris and the ciliary muscles all enable the eyes to accommodate properly. The external muscles lengthen and shorten the eyeball to enable light rays to fall upon the macula. The iris adjusts the pupil for the amount of light necessary to see clearly. And the ciliary muscle contracts the lens to focus upon the object. The ciliary muscle changes the lens and directs the rays of light to focus upon the macula or center of sight. While looking at a distant object of more than twenty feet away, the rays come into the eyes parallel. When looking at a close point rays come into the eyes at an angle. The normal eye must accommodate these rays in order to see clearly a close or distant point. All rays from

Memory Richard F. Thompson, Stephen A. Madigan, 2007-09-02 Originally published: Washington D.C.: Joseph Henry Press, 2005.

Tutorials in Visual Cognition Veronika Coltheart, 2011-01-07 In the late-1980s, visual cognition was a small subfield of cognitive psychology, and the standard texts mainly discussed just iconic memory in their sections on visual cognition. In the subsequent two decades, and especially very recently, many remarkable new aspects of the processing of brief visual stimuli have been discovered -- change blindness, repetition blindness, the attentional blink, newly-discovered properties of visual short-term memory and of the face recognition system, the influence of reentrant processing on visual perception, and the surprisingly intimate relationships between eyeblinks and visual cognition. This volume provides up-to-date tutorial reviews of these many new developments in the study of visual cognition written by the leaders in the discipline, providing an incisive and comprehensive survey of research in this dynamic field.
