Changing the Game David Edery, Ethan Mollick, 2008-10-07 Use Video Games to Drive Innovation, Customer Engagement, Productivity, and Profit! Companies of all shapes and sizes have begun to use games to revolutionize the way they interact with customers and employees, becoming more competitive and more profitable as a result. Microsoft has used games to painlessly and cost-effectively quadruple voluntary employee participation in important tasks. Medical schools have used game-like simulators to train surgeons, reducing their error rate in practice by a factor of six. A recruiting game developed by the U.S. Army, for just 0.25% of the Army's total advertising budget, has had more impact on new recruits than all other forms of Army advertising combined. And Google is using video games to turn its visitors into a giant, voluntary labor force--encouraging them to manually label the millions of images found on the Web that Google's computers cannot identify on their own. Changing the Game reveals how leading-edge organizations are using video games to reach new customers more cost-effectively; to build brands; to recruit, develop, and retain great employees; to drive more effective experimentation and innovation; to supercharge productivity...in short, to make it fun to do business. This book is packed with case studies, best practices, and pitfalls to avoid. It is essential reading for any forward-thinking executive, marketer, strategist, and entrepreneur, as well as anyone interested in video games in general. In-game advertising, advergames, adverworlds, and beyond Choose your best marketing opportunities--and avoid the pitfalls Use gaming to recruit and develop better employees Learn practical lessons from America's Army and other innovative case studies Channel the passion of your user communities Help your customers improve your products and services--and have fun doing it What gamers do better than computers, scientists, or governments Use games to solve problems that can't be solved any other way

Security Protocols Bruce Christianson, Bruno Crispo, James A. Malcolm, Michael Roe, 2009-10-13 Welcome back to the International Security Protocols Workshop. Our theme for this, the 14th workshop in the series, is “Putting the Human Back in the Protocol”. We’ve got into the habit of saying “Of course, Alice and Bob aren’t really people. Alice and Bob are actually programs running in some computers.” But we build computer systems in order to enable people to interact in accordance with certain social protocols. So if we’re serious about system services being end-to-end then, at some level of abstraction, the end points Alice and Bob are human after all. This has certain consequences. We explore some of them in these proceedings, in the hope that this will encourage you to pursue them further. Is Alice talking to the correct stranger? Our thanks to Sidney Sussex College, Cambridge for the use of their facilities, and to the University of Hertfordshire for lending us several of their staff. Particular thanks once again to Lori Klimasewska of the University of Cambridge Computing Service for transcribing the audio tapes, and to Virgil Gligor for acting as our advisor.

Games with a Purpose (GWAPS) Mathieu Lafourcade, Alain Joubert, Nathalie Le Brun, 2015-06-29 Human brains can be seen as knowledge processors in a distributed system. Each of them can achieve, conscious or not, a small part of a treatment too important to be done by one. These are also hunter / gatherers of knowledge. Provided that the number of contributors is large enough, the results are usually better quality than if they were the result of the activity of a single person, even if it is a domain expert. This type of activity is done via online games.

Emerging Security Algorithms and Techniques Khaleel Ahmad, M. N. Doja, Nur Izura Udzir, Manu Pratap Singh, 2019-05-20 Cyber security is the protection of information systems, hardware, software, and information as well from theft, damages, interruption or misdirection to any of these resources. In other words, cyber security focuses on protecting computers, networks, programs and data (in use, in rest, in motion) from unauthorized or unintended access, change or destruction. Therefore, strengthening the security and resilience of cyberspace has become a vital homeland security mission. Cyber security attacks are growing exponentially. Security specialists must occupy in the lab, concocting new schemes to preserve the resources and to control any new attacks. Therefore, there are various emerging algorithms and techniques viz. DES, AES, IDEA, WAKE, CAST5, Serpent Algorithm, Chaos-Based Cryptography McEliece, Niederreiter, NTRU, Goldreich-Goldwasser-Halevi, Identity Based Encryption, and Attribute Based Encryption. There are numerous applications of security algorithms like cyber security, web security, e-commerce, database security, smart card technology, mobile security, cloud security, digital signature, etc. The book offers comprehensive coverage of the most essential topics, including: Modular Arithmetic, Finite Fields Prime Number, DLP, Integer Factorization Problem Symmetric Cryptography Asymmetric Cryptography Post-Quantum Cryptography Identity Based Encryption Attribute Based Encryption Key Management Entity Authentication, Message Authentication Digital Signatures Hands-On SageMath This book serves as a textbook/reference book for UG, PG, PhD students, Teachers, Researchers and Engineers in the disciplines of Information Technology, Computer Science and Engineering, and Electronics and Communication Engineering.

Mutually Reinforcing Systems John Urquhart Ferguson,2011-08-12 People can be used by computers to solve problems. In most cases this 'human computation' is used to gather information that computers struggle to create. These problems can be phrased as games to provide an incentive for people to do the work. In the past, these games have captured a broad level of information in the hope that specific needs will be covered. But what happens when we need specific information that the games have not been designed to create? Mutually reinforcing systems are a new approach to human computation that tries to attain this focus by allowing multiple systems to work together so that each one can benefit from the other's strengths. This dissertation shows that extending human computation techniques to allow the collection and classification of useful contextual information in mobile environments is possible and can be extended to allow the by-products to match the specific needs of another system.
