I Don’t Text While Driving, Walking, or Standing Still Roger Dale Loring,2016-06-27 Roger Dale Loring is a genuine baby boomer who finds his existence in the rapidly-changing world rather perplexing. In his latest book, he once again offers a collection of lighthearted essays about his dilemmas from the perspective of his current if-they-don't-have-a-senior-discount, I'm-not-going-there age. Realizing that the aging process evolved in a way that his adolescent mind never envisioned, Loring now finds that his views on life changes are disturbingly similar to the views of the old people of his youth, people he frequently characterized as old fogies. His essays highlight his humorous take on life that include opinions about issues such as cell phone upgrades; a man's attention span while operating a television remote; seasonal purse shopping; the differing conversation patterns of men and women; the three hardest part-time jobs in America; the crazy world of politics where preaching to the choir dominates all campaigns; and, of course, the trauma of buying toothpaste.

Coordinate Systems for Games Daniel T. Jessie,Donald G. Saari,2019-12-13 This monograph develops a method of creating convenient coordinate systems for game theory that will allow readers to more easily understand, analyze, and create games at various levels of complexity. By identifying the unique characterization of games that separates the individual’s strategic interests from the group’s collective behavior, the authors construct a single analytical methodology that readers will be able to apply to a wide variety of games. With its emphasis on practicality and approachability, readers will find this book an invaluable tool, and a viable alternative to the ad hoc analytical approach that has become customary for researchers utilizing game theory. The introductory chapters serve two important purposes: they review several games of fundamental importance, and also introduce a dynamic that is inherent in games, but has gone unexplored until now. After this has been established, readers will advance from simple 2 x 2 games to games with more player strategies and dynamics. For interested readers, a rigorous treatment of the underlying mathematics is conveniently gathered at the end of the book. Additional topics of interest, such as extensive form and coalitional games, are presented to help readers visualize more complex settings that will be vital in aiding the understanding of advanced topics, such as coalition-free Nash points, multi-player repeated games, and more. Coordinate Systems for Games is ideal for a wide variety of researchers interested in game theory, including social scientists, economists, mathematicians, computer scientists, and more. The authors' approachable style also makes this accessible to an audience at any scale of experience, from beginning non-specialists to more practiced researchers.

Distributed Moving Base Driving Simulators Anders Andersson,2019-04-30 Development of new functionality and smart systems for different types of vehicles is accelerating with the advent of new emerging technologies such as connected and autonomous vehicles. To ensure that these new systems and functions work as intended, flexible and credible evaluation tools are necessary. One example of this type of tool is a driving simulator, which can be used for testing new and existing vehicle concepts and driver support systems. When a driver in a driving simulator operates it in the same way as they would in actual traffic, you get a realistic evaluation of what you want to investigate. Two advantages of a driving simulator are (1.) that you can repeat the same situation several times over a short period of time, and (2.) you can study driver reactions during dangerous situations that could result in serious injuries if they occurred in the real world. An important component of a driving simulator is the vehicle model, i.e., the model that describes how the vehicle reacts to its surroundings and driver inputs. To increase the simulator realism or the computational performance, it is possible to divide the vehicle model into subsystems that run on different computers that are connected in a network. A subsystem can also be replaced with hardware using so-called hardware-in-the-loop simulation, and can then be connected to the rest of the vehicle model using a specified interface. The technique of dividing a model into smaller subsystems running on separate nodes that communicate through a network is called distributed simulation. This thesis investigates if and how a distributed simulator design might facilitate the maintenance and new development required for a driving simulator to be able to keep up with the increasing pace of vehicle development. For this purpose, three different distributed simulator solutions have been designed, built, and analyzed with the aim of constructing distributed simulators, including external hardware, where the simulation achieves the same degree of realism as with a traditional driving simulator. One of these simulator solutions has been used to create a parameterized powertrain model that can be configured to represent any of a number of different vehicles. Furthermore, the driver's driving task is combined with the powertrain model to monitor deviations. After the powertrain model was created, subsystems from a simulator solution and the powertrain model have been transferred to a Modelica environment. The goal is to create a framework for requirement testing that guarantees sufficient realism, also for a distributed driving simulation. The results show that the distributed simulators we have developed work well overall with satisfactory performance. It is important to manage the vehicle model and how it is connected to a distributed system. In the distributed driveline simulator setup, the network delays were so small that they could be ignored, i.e., they did not affect the driving experience. However, if one gradually increases the delays, a driver in the distributed simulator will change his/her behavior. The impact of communication latency on a distributed simulator also depends on the simulator application, where different usages of the simulator, i.e., different simulator studies, will have different demands. We believe that many simulator studies could be performed using a distributed setup. One issue is how modifications to the system affect the vehicle model and the desired behavior. This leads to the need for methodology for managing model requirements. In order to detect model deviations in the simulator environment, a monitoring aid has been implemented to help notify test managers when a model behaves strangely or is driven outside of its validated region. Since the availability of distributed laboratory equipment can be limited, the possibility of using Modelica (which is an equation-based and object-oriented programming language) for simulating subsystems is also examined. Implementation of the model in Modelica has also been extended with requirements management, and in this work a framework is proposed for automatically evaluating the model in a tool.

Australian Sport Kristine Toohey,Tracy Taylor,2013-10-18 Australia is only a small player in the world's political and economic landscapes, yet, for many decades, it has been considered to be a global powerhouse in terms of its sporting successes. In conjunction with this notion, the nation has long been portrayed as having a preoccupation with sport. This labelling has been seen as both a blessing and a curse. Those who value a Bourdieuan view of culture bemoan sport's centrality to the national imagination and the consequent lack of media coverage, funding and prestige accorded to the arts. Other scholars question whether the popular stereotype of the Australian sportsman is, in fact, a myth and that instead Australians are predominantly passive sport consumers rather than active sport participants. Australian sport, through its successes on the field of play and in advancing sport coaching and management, has undergone a revolution, as both an enabler of global processes and as subject to its influences (economic, political, migratory etc.). This book will examine the shifting place of Australian sports in current global and local environs, from the perspective of spectators, players and administrators. This book was previously published as a special issue of Sport in Society.
