**The Clinician's Guide to Geriatric Forensic Evaluations** Karen Reimers,2019-06-15 The Clinician's Guide to Geriatric Forensic Evaluations provides practical guidance to clinicians performing forensic evaluations on older adults. The book begins with how geriatric forensic evaluations differ from those done on non-geriatric adults. DSM-5 criteria for neurocognitive disorders are discussed and differentiated from the previous criteria in DSM-IV. Coverage includes assessing decision-making capacity/competence and evaluating undue influence, elder abuse, and financial exploitation. Each chapter opens with a case study and then highlights specific assessment techniques, best practices, and common pitfalls to avoid. The book additionally covers forensic report writing, court testimony, and when to refer to an outside independent expert. Samples of geriatric forensic reports are provided. Provides practical information on performing geriatric forensic evaluations Identifies DSM-5 criteria for neurocognitive disorders Includes assessing decision-making capacity/competence, undue influence, elder abuse, and financial exploitation Features assessment strategies, case studies, best practices, and pitfalls to avoid Advises on report writing and court testimony

**Global Aspects of Atmospheric Chemistry** ,1999-03-01 Atmospheric Chemistry has been a rapidly growing field with a recent focus on the major aspects of global environmental change, including stratospheric ozone depletion, UV-B change, and global warming. This book describes recent developments in our understanding of the global aspects of the chemistry in the main parts of the atmosphere, troposphere, and stratosphere, as obtained from field observations, laboratory investigations, and modeling studies. Although this chemistry is largely driven by reactions between gas phase species, recent progress made in the understanding of chemical reactions occurring in clouds and on the surface of aerosols is also reported.

**Drugs: Synonyms and Properties** G W A Milne,2017-11-01 This title was first published in 2002: Drugs: Synonyms and Properties provides comprehensive coverage of the 10,000 drugs currently in common use worldwide. Its overall organization and inclusion of detailed chemical information fills an important gap in drug information. This reference, edited by a world-renowned authority in drug design and chemical information and now in its second edition, has become one of the bibles of pharmaceutical research and application. This book organizes the 10,000 drugs currently in use by therapeutic category. Therefore all tranquilizers, all antidepressants, or all anorexic agents, for example, are grouped together. In all, 204 categories are represented. This arrangement means that all drugs in a given category can be reviewed very easily and their relative properties compared quickly. A key component of this reference is the extensive coverage of synonyms. The book includes an index of over 30,000 drug synonyms and trade names with a cross-reference to their main entry. This extraordinarily comprehensive view of trade names and generic synonyms makes Drugs: Synonyms and Properties one of the world's most exhaustive references in its field. For each main entry, the

following information is provided: chemical name and a list of trade names and synonyms; the Chemical Abstracts Service (CAS) Registry Number; the European Inventory of Existing Commercial Chemical Substances (EINECS) Number; the Merck Index (Twelfth Edition) Number; the physical properties of each compound; and the known biological activity and indicated applications. Indexes, including a master index of names and synonyms, and of manufacturers and suppliers, are appended. This reference will be invaluable to research chemists, biologists, and physicians and to anyone interested in drugs who, starting with a single synonym for a drug, will be able to quickly find a thumbnail sketch of the essential information concerning that agent.

*Tunneling in Biological Systems* Britton Chance, Don Charles Devault, Hans Frauenfelder, 2013-09-17 Tunneling in Biological Systems focuses on the low temperature electron transport that reveals a quantum-mechanical effect called "tunneling. This book discusses the tunneling in physical systems; detection of molecular vibrations with electron tunneling; chemical-rate theory of small-polaron hopping; and experimental approaches to electronic coupling in metal ion redox systems. The Faraday rotation and photoconductivity of photosynthetic structures at microwave frequencies; dynamics of electron transport in macromolecules; and electron transfer reactions in cytochrome oxidase are also elaborated. This text likewise covers the kinetic evidence for electron tunneling in solution; specificity and control in biological systems; molecular tunneling in heme proteins; and ligand binding. This publication is valuable to students and researchers interested in the physics of biological and medical problems.

Atmospheric Chemistry Ann M Holloway, Richard P Wayne, 2015-11-09 Atmospheric Chemistry provides readers with a basic knowledge of the chemistry of Earth's atmosphere, and an understanding of the role that chemical transformations play in this vital part of our environment. The composition of the 'natural' atmosphere (troposphere, stratosphere and mesosphere) is described in terms of the physical and chemical cycles that govern the behaviour of the major and the many minor species present, and of the atmospheric lifetimes of those species. An extension of these ideas leads to a discussion of the impacts of Man's activities on the atmosphere, and to an understanding of some of the most important environmental issues of our time. One thread of the book explains how living organisms alter the composition and pressures in the atmosphere, modify temperatures, and change the intensity and wavelength-distribution of light arriving from the Sun. Meanwhile, the living organisms on Earth have depended on these very same environmental conditions being satisfactory for the maintenance and evolution of life. There thus appear to be two-way interactions between life and the atmosphere. Man, just one species of living organism, has developed an unfortunate ability to interfere with the feedbacks that seem to have maintained the atmosphere to be supportive of surface life for more than 3.5 billion years. This book will help chemists to understand the background to the problems that arise from such interference. The structure of the book and the development of the subject deviate somewhat from those usually encountered. Important and recurring concepts are presented in outline first, before more detailed discussions of the atmospheric behaviour of specific chemical species. Examples of such themes are the sources and sinks of trace gases, and their budgets and lifetimes. That is, the emphasis is initially on the principles of the subject,

with the finer points emerging at later points in the book, sometimes in several successive chapters. In this way, some of the core material gets repeated exposure, but in new ways and in new contexts. The book is written at a level that makes it accessible to undergraduate chemists, and in a manner that should make it interesting to them. However, the material presented forms a solid base for those who are extending their studies to a higher level, and it will also provide non-specialists with the background to an understanding of Man's several and varied threats to the atmosphere. Well-informed citizens can then better assess measures proposed to prevent or alleviate the potential damage, and policy makers more realistically formulate the necessary controls on a sound scientific foundation.

**Reality and Measurement in Algebraic Quantum Theory** Masanao Ozawa,Jeremy Butterfield,Hans Halvorson,Miklós Rédei,Yuichiro Kitajima,Francesco Buscemi,2018-11-02 This volume contains papers based on presentations at the “Nagoya Winter Workshop 2015: Reality and Measurement in Algebraic Quantum Theory (NWW 2015)”, held in Nagoya, Japan, in March 2015. The foundations of quantum theory have been a source of mysteries, puzzles, and confusions, and have encouraged innovations in mathematical languages to describe, analyze, and delineate this wonderland. Both ontological and epistemological questions about quantum reality and measurement have been placed in the center of the mysteries explored originally by Bohr, Heisenberg, Einstein, and Schrödinger. This volume describes how those traditional problems are nowadays explored from the most advanced perspectives. It includes new research results in quantum information theory, quantum measurement theory, information thermodynamics, operator algebraic and category theoretical foundations of quantum theory, and the interplay between experimental and theoretical investigations on the uncertainty principle. This book is suitable for a broad audience of mathematicians, theoretical and experimental physicists, and philosophers of science.
