Natural Resources - Technology, Economics & Policy U. Aswathanarayana,2012-03-22 Natural resources management has two principal dimensions : Science-illuminated (earth, space, hydrological, pedological, information, etc. sciences) management of local resources (waters, soils, bioresources, minerals, rocks, sediments, etc.) in an ecologically-sustainable manner, and Value-addition through processing of natural products, through the application of technology is most marked in the case of some mineral products. The wellness of a community is dependent upon the security of food, water, environment and energy. Such a security is best realised through science-illuminated (earth, space, hydrological, pedological, information) management of local resources (waters, soils, bioresources, minerals, rocks, sediments, etc.) in an ecologically-sustainable and people-participatory manner, plus value-addition through processing of natural products. Moreover, the addition of value may increase a community's wealth by advanced technologies, trading, exchange of knowledge, etc. Moreover, activities, employment and many other things come along with the availability of natural resources, which will require and affect policy. This volume provides guidelines for the implementation of technological, economical and policy advances in dealing with various aspects of natural resources. It is intended for researchers, professionals and students in environmental and earth sciences, mining, geography, sociology, economics and for policy makers and investors searching for potential in the natural resources industry. Ideal for consultation in combination with the editor's related publications Green Energy: Technology, Economics and Policy, Energy Portfolios and Food and Water Security.

Trace Analysis Susanta Lahiri,2008 Trace Analysis has never been more important than today, where the surveillance of environmental pollution requires the determination of different elements and other harmful substances at parts per billion levels in various types of samples. The trace analysis is important from the view point of basic to applied sciences. For example, measurement of cosmogenic radionuclides like ²⁶Al, ¹⁰Be, ¹²⁹I, down to 1 in 10¹⁵ ratio will provide information about the cosmic radiation patterns in our environment, rates of erosion and deposition, dating of marine sediments, petroleum, etc. The measurement of supernovae (SN) produced long lived radionuclides like ¹⁴⁶Sm, ¹⁸²Hf, etc., will be helpful to unravel the history of formation of earth and the galactic drama that occurred million years before present. Similarly, determination of trace elements is useful in a number of different fields including drinking water, wastewater, natural water systems/hydrogeology, geology, metallurgy, food sciences, etc. Exploring the trace analysis for the benefit of mankind, it is equally essential to have a vivid idea about the various modern techniques of analysis. A large variety of modern analytical methods allow specific tailor-made control and analysis of different substrates. A thorough knowledge of different hyphenated techniques used for trace analysis, and their relevance in modern sciences is therefore required for the budding scientists throughout the world. A book solely devoted to 'TRACE ANALYSIS' will be first of its kind in India.
