This book may also be missing information in regard to things that I do not approve of, which is why I did not write about them/tell you how to install them and how they work etc. This book will give my, the authors, opinions, many of which are also facts, about mostly everything IT related, including about certifications. Any information contained within this book may change over time. Please be aware that the Kindle/eBook edition(s) of this book may have slightly different chapter names

due to Kindle formatting differentiations. I, the author, have done everything I can do on my end to make your eBook experience the best it can be for you. I, the author, recommend that you have a basic understanding of basic computer operations before you purchase and or read this book. After you finish reading this book, it would be greatly appreciated if you could kindly leave a review on the platform that you purchase the book from. It would be able to tell me what I need to do better or what I could add to the book in the future, as I am always looking for ways to improve the book, and add the latest and greatest information that I have.

**On the Shadow Cpu Approximation for Modelling
Priority Scheduling in Computer Systems (Classic Reprint)**

Paul G. Spirakis, 2015-08-04 Excerpt from On the Shadow Cpu

Approximation for Modelling Priority Scheduling in Computer Systems A sound performance evaluation methodology is essential to the design and use of computer systems. Among performance evaluation methods, queuing network models have been widely recognized as cost and time effective tools, capable of predicting ability and necessary complements of simulations. Algorithms for efficiently estimating the throughput, response time and other measures of performance have been devised for a broad range of queuing network models. Although this range is very rich and adequate for modelling many realistic features of a computer system, nevertheless it has major limitations. An important one is the inability to model pre-emptive priority scheduling disciplines. Although exact closed-form solutions for such network models are open research problems, several approximation techniques have been proposed. An important one was Sevcik's [Sevc, 77] shadow CPU technique, which admits a product form solution and gives performance bounds which are quite tight in many circumstances. In this paper, we extend the shadow CPU model to an optimal approximation of the priority model, within the restrictions of the product form. We propose a computationally efficient sub-optimal approximation technique which gives tighter performance bounds compared to the original shadow CPU technique. We also investigate the limitations of such shadow server-product form techniques for modelling priorities.
