Strategies to Improve Cardiac Arrest Survival Institute of Medicine,Board on Health Sciences Policy,Committee on the Treatment of Cardiac Arrest: Current Status and Future Directions,2015-09-29 Cardiac arrest can strike a seemingly healthy individual of any age, race, ethnicity, or gender at any time in any location, often without warning. Cardiac arrest is the third leading cause of death in the United States, following cancer and heart disease. Four out of five cardiac arrests occur in the home, and more than 90 percent of individuals with cardiac arrest die before reaching the hospital. First and foremost, cardiac arrest treatment is a community issue - local resources and personnel must provide appropriate, high-quality care to save the life of a community member. Time between onset of arrest and provision of care is fundamental, and shortening this time is one of the best ways to reduce the risk of death and disability from cardiac arrest. Specific actions can be implemented now to decrease this time, and recent advances in science could lead to new discoveries in the causes of, and treatments for, cardiac arrest. However, specific barriers must first be addressed. Strategies to Improve Cardiac Arrest Survival examines the complete system of response to cardiac arrest in the United States and identifies opportunities within existing and new treatments, strategies, and research that promise to improve the survival and recovery of patients. The recommendations of Strategies to Improve Cardiac Arrest Survival provide high-priority actions to advance the field as a whole. This report will help citizens, government agencies, and private industry to improve health outcomes from sudden cardiac arrest across the United States.

Independent Prescribing for General Practice Nurses Amanda Blaber,Hannah Morris,Jennifer Gorman,Donna Goddard,2021-10-06 General Practice Nurses play an essential role in delivering care through general practice, taking on a spectrum of different responsibilities within patient care to support the ever-increasing workload within GP surgeries, clinics and health centres. Often working autonomously, as part of a multidisciplinary team, general practice nurses assess, advise and treat patients of all different ages and backgrounds, and therefore may encounter almost every aspect of patient care during their work. This book is specifically aimed at GP Nurses undertaking independent prescribing within the complexity of contemporary primary healthcare. It offers a complete overview for those taking on an independent nurse prescribing course as well as those nurses who have already qualified as independent prescribers. Case studies written for the general practice setting will help nurses build on the skills and practice they have already developed as they take on the independent prescribing role, and will also be of value to more experienced or advanced nurses hoping to refresh their existing knowledge. Written by a range of specialist authors, the book also covers the theoretical knowledge and context associated with independent prescribing, enabling GP nurses to practise competently and confidently and deliver clinically effective, person-centred care.

Caring for People who Sniff Petrol Or Other Volatile Substances National Health and Medical Research Council (Australia),2011 These guidelines provide recommendations that outline the critical aspects of infection prevention and control. The recommendations were developed using the best available evidence and consensus methods by the Infection Control Steering Committee. They have been prioritised as key areas to prevent and control infection in a healthcare facility. It is recognised that the level of risk may differ according to the different types of facility and therefore some recommendations should be justified by risk assessment. When implementing these recommendations all healthcare facilities need to consider the risk of transmission of infection and implement according to their specific setting and circumstances.
