Databases in Telecommunications II Willem Jonker,2003-06-30 Just like the previous workshop at VLDB 1999 in Edinburgh, the purpose of this workshop is to promote telecom data management as one of the core research areas in database research and to establish a strong connection between the telecom and database research communities. As I wrote in the preface of those proceedings, data management in telecommuni- tions is an interesting area of research given the fact that both service management and service provisioning are very data intensive, and pose extreme requirements on data management technology. Given the feedback on the previous workshop we decided to keep the same program set-up for this workshop: an invited speaker, a collection of research papers, and a panel discussion. We received 18 good quality papers from which we selected 12 to construct a very interesting program. The program has been divided into four sections. The first section focuses on CDR data warehouse and data mining technology. Data warehousing and data mining around customer usage data remains an important area of interest for telecommunication operators. The growing competition, especially in the mobile market, means that operators have to put more effort into customer retention and satisfaction. The second section focuses on performance issues around

databases in telecommunication. Since
telecommunication databases are characterized by
their extreme requirements, for example in terms
of volumes of data to be processed or response
times, high volume data management and embedded
and real-time data management are key aspects of
the telecommunication data management problems in
today's operational environments.

  <u>Joe Celko's Data, Measurements and Standards in
SQL</u> Joe Celko,2009-09-22 Joe Celko has looked deep
into the code of SQL programmers and found a
consistent and troubling pattern - a frightening
lack of consistency between their individual
encoding schemes and those of the industries in
which they operate. This translates into a series
of incompatible databases, each one an island unto
itself that is unable to share information with
others in an age of internationalization and
business interdependence. Such incompatibility
severely hinders information flow and the quality
of company data. Data, Measurements and Standards
in SQL reveals the shift these programmers need to
make to overcome this deadlock. By collecting and
detailing the diverse standards of myriad
industries, and then giving a declaration for the
units that can be used in an SQL schema, Celko
enables readers to write and implement portable
data that can interface to any number of external
application systems! This book doesn't limit
itself to one subject, but serves as a detailed
synopsis of measurement scales and data standards
for all industries, thereby giving RDBMS

programmers and designers the knowledge and know-how they need to communicate effectively across business boundaries. * Collects and details the diverse data standards of myriad industries under one cover, thereby creating a definitive, one-stop-shopping opportunity for database programmers. * Enables readers to write and implement portable data that can interface to any number external application systems, allowing readers to cross business boundaries and move up the career ladder. * Expert advice from one of the most-read SQL authors in the world who is well known for his ten years of service on the ANSI SQL standards committee and Readers Choice Award winning column in Intelligent Enterprise.

Data Management for Mobile Computing Evaggelia Pitoura,George Samaras,2012-12-06 Earth date, August 11, 1997 Beam me up Scottie! We cannot do it! This is not Star Trek's Enterprise. This is early years Earth. True, this is not yet the era of Star Trek, we cannot beam captain James T. Kirk or captain Jean Luc Pickard or an apple or anything else anywhere. What we can do though is beam information about Kirk or Pickard or an apple or an insurance agent. We can beam a record of a patient, the status of an engine, a weather report. We can beam this information anywhere, to mobile workers, to field engineers, to a track loading apples, to ships crossing the Oceans, to web surfers. We have reached a point where the promise of information access anywhere and anytime is close to realization. The enabling technology,

wireless networks, exists; what remains to be achieved is providing the infrastructure and the software to support the promise. Universal access and management of information has been one of the driving forces in the evolution of computer technology. Central computing gave the ability to perform large and complex computations and advanced information manipulation. Advances in networking connected computers together and led to distributed computing. Web technology and the Internet went even further to provide hyper-linked information access and global computing. However, restricting access stations to physical location limits the boundary of the vision.

DW 2.0: The Architecture for the Next Generation of Data Warehousing W.H. Inmon,Derek Strauss,Genia Neushloss,2010-07-28 DW 2.0: The Architecture for the Next Generation of Data Warehousing is the first book on the new generation of data warehouse architecture, DW 2.0, by the father of the data warehouse. The book describes the future of data warehousing that is technologically possible today, at both an architectural level and technology level. The perspective of the book is from the top down: looking at the overall architecture and then delving into the issues underlying the components. This allows people who are building or using a data warehouse to see what lies ahead and determine what new technology to buy, how to plan extensions to the data warehouse, what can be salvaged from the current system, and how to justify the expense at the most practical level. This book gives experienced data warehouse professionals everything they need in order to implement the new generation DW 2.0. It is designed for professionals in the IT organization, including data architects, DBAs, systems design and development professionals, as well as data

warehouse and knowledge management professionals. * First book on the new generation of data warehouse architecture, DW 2.0. * Written by the father of the data warehouse, Bill Inmon, a columnist and newsletter editor of The Bill Inmon Channel on the Business Intelligence Network. * Long overdue comprehensive coverage of the implementation of technology and tools that enable the new generation of the DW: metadata, temporal data, ETL, unstructured data, and data quality control.

Building and Maintaining a Data Warehouse Fon Silvers,2008-03-18 As it is with building a house, most of the work necessary to build a data warehouse is neither visible nor obvious when looking at the completed product. Foundations of Data Quality Management Wenfei Fan,Floris Geerts,2022-05-31 Data quality is one of the most important problems in data management. A database system typically aims to support the creation, maintenance, and use of large amount of data, focusing on the quantity of data. However, real-life data are often dirty: inconsistent, duplicated, inaccurate, incomplete, or stale. Dirty data in a database routinely generate misleading or biased analytical results and decisions, and lead to loss of revenues,

credibility and customers. With this comes the
need for data quality management. In contrast to
traditional data management tasks, data quality
management enables the detection and correction of
errors in the data, syntactic or semantic, in
order to improve the quality of the data and
hence, add value to business processes. While data
quality has been a longstanding problem for
decades, the prevalent use of the Web has
increased the risks, on an unprecedented scale, of
creating and propagating dirty data. This
monograph gives an overview of fundamental issues
underlying central aspects of data quality,
namely, data consistency, data deduplication, data
accuracy, data currency, and information
completeness. We promote a uniform logical
framework for dealing with these issues, based on
data quality rules. The text is organized into
seven chapters, focusing on relational data.
Chapter One introduces data quality issues. A
conditional dependency theory is developed in
Chapter Two, for capturing data inconsistencies.
It is followed by practical techniques in Chapter
2b for discovering conditional dependencies, and
for detecting inconsistencies and repairing data
based on conditional dependencies. Matching
dependencies are introduced in Chapter Three, as
matching rules for data deduplication. A theory of
relative information completeness is studied in
Chapter Four, revising the classical Closed World
Assumption and the Open World Assumption, to
characterize incomplete information in the real
world. A data currency model is presented in
Chapter Five, to identify the current values of

entities in a database and to answer queries with the current values, in the absence of reliable timestamps. Finally, interactions between these data quality issues are explored in Chapter Six. Important theoretical results and practical algorithms are covered, but formal proofs are omitted. The bibliographical notes contain pointers to papers in which the results were presented and proven, as well as references to materials for further reading. This text is intended for a seminar course at the graduate level. It is also to serve as a useful resource for researchers and practitioners who are interested in the study of data quality. The fundamental research on data quality draws on several areas, including mathematical logic, computational complexity and database theory. It has raised as many questions as it has answered, and is a rich source of questions and vitality.   Mobile Data Management Kian-Lee Tan,Michael J. Franklin,John C.-S. Lui,2003-06-29 Welcome to the Second International Conference on Mobile Data Management (MDM2001). The conference serves as a forum for the exchange of technical ideas and

research results in the areas of mobility and database management. This year, we have a very exciting program for MDM2001. Many quality papers were submitted to the conference. All of the submitted papers were - viewed by at least three PC members. Due to the limitations of the program schedule as well as the desire to organize the conference using a single track format, we selected only 18 papers for full presentation at the conference. As a result many excellent papers could not be accepted. The papers chosen for presentation span a large range of topics, from n-work protocol issues up to the semantics of mobile applications. The common theme of all these papers is their recognition of the central role played by data managementtechniques in the developmentof the emerging worldof mobile and wireless applications. We have loosely organized these papers into six areas: 1. DATA MANAGEMENT ARCHITECTURES, 2. CONTENT DELIVERY, 3. DATA BROADCASTING, 4. CACHING AND HOARDING, 5. COPING WITH MOVEMENT, 6. NETWORKS AND SYSTEMS ISSUES In addition to the researchtrack, we havesought to broaden the scope of the conference with an industrial session as well as poster presentations. Overall, the program strikes a comfortable balance between applied and theoretically oriented papers.

  Mobile Big Data Xiang Cheng,Luoyang Fang,Liuqing Yang,Shuguang Cui,2018-08-23 This book provides a comprehensive picture of mobile big data starting from data sources to mobile data driven applications. Mobile Big Data comprises two main components: an overview of mobile big data, and

the case studies based on real-world data recently collected by one of the largest mobile network carriers in China. In the first component, four areas of mobile big data life cycle are surveyed: data source and collection, transmission, computing platform and applications. In the second component, two case studies are provided, based on the signaling data collected in the cellular core network in terms of subscriber privacy evaluation and demand forecasting for network management. These cases respectively give a vivid demonstration of what mobile big data looks like, and how it can be analyzed and mined to generate useful and meaningful information and knowledge. This book targets researchers, practitioners and professors relevant to this field. Advanced-level students studying computer science and electrical engineering will also be interested in this book as supplemental reading.
