Modeling the Environment Bradley Cantrell, Natalie Yates, 2012-03-27 A single-source guide to harnessing the power of 3D visualization tools for analysis and representation of landscapes Current technology allows designers to model environmental phenomena and space in new and exciting ways that go beyond the two-dimensional plane. The models, illustrations, and animations that can be created usher in a new paradigm of landscape representation that can become analytical tools as well as beautiful imagery. The text focuses on digital modeling methods that can be used to express rich environments using digital tools to develop, composite, and animate scenes. This full-color book provides coverage of 3D visualization tools for land planning and landscape architecture. The methods and theories in *Modeling the Environment* present landscape representation around a core set of ideas—scene, object, terrain, environment/atmosphere, time/dynamics, and the composite—that centers representation on human experience. Supported by www.lab.visual-logic.com, a website offering tutorials and forums, the text shows you how to use Autodesk 3ds Max to create dynamic landscape environments while also referring to a range of other tools including Google SketchUp, Autodesk Maya, and AutoCAD Civil 3D. It also demonstrates how to integrate 3D visualization tools into existing workflows, and offers critical coverage of intelligent drawings and representations, giving you a glimpse at the future of the profession. This book: Includes sections intended to build upon one another in order to understand the environment as a composite representation of multiple systems interacting Shows how to integrate

3D visualization tools into existing workflows, as opposed to offering an entirely new workflow Emphasizes modeling, animation, and simulation as both design analysis tools and presentation tools Modeling the Environment is essential reading for professionals in landscape architecture, urban planning and design, architecture, and related disciplines who are looking to be at the forefront of technology.

Daylight Simulation with Photon Maps Roland Schregle, 2005 Physically based image synthesis remains one of the most demanding tasks in the computer graphics field. Unlike mainstream applications which merely demand visually convincing images and short rendering times, physically based rendering emphasises accuracy at the cost of increased computational overhead. Among its more specialised applications is lighting simulation, particularly in conjunction with daylight. Many materials used in daylight simulation are specifically designed to redirect light, and as such give rise to complex effects such as caustics. Density estimation algorithms such as the photon map are well suited to efficiently render these effects. This thesis investigates the photon maps applicability to daylight simulation by assessing its ability to produce physically correct results. To this end, a method to compensate for inherent bias in the reconstructed illumination is proposed. Furthermore, the thesis documents a methodology for validating the photon map based on analytical case studies and measurements from simple experimental setups.
