Determining Distance to Lightning Strokes from a Single Station Lothar H. Ruhnke,1971 A study has been made to use the differences between the decay of electric and magnetic fields near lightning strokes to determine the distance from a single station to the lightning. In our analysis a model of a return stroke is used to compute the waveform of electric and magnetic fields, between 1 km and 100 km distance, and the associated frequency spectrum. At distances small compared with the length of the return stroke channel, the electric field and also the magnetic field decrease inversely with distance from the stroke. From 3 km to 30 km the electric field, when observed at 1 kHz decreases approximately with the cube of the distance, while the magnetic field decreases with the square of the distance. For distances farther than 30 km, both signals decay inversely with distance. On an observation frequency of 1 kHz, it is possible to determine distances to return stroke channels between 3 km to 30 km by using the ratio of magnetic field to electric field. For this range, this ratio is independent of waveform and magnitude of the lightning signal. A prototype instrument was designed and tested during one thunderstorm season. The instrument uses loop antennas for sensing magnetic fields and horizontal wire antennas for sensing the electric field, and contains sharp filters, amplifiers, and peak voltage detectors. For the output, strip chart recorders are used. Data obtained with this instrument verify the predicted possibility of determining from a single station the distance to lightning strokes.

**Determining the Horizontal Distance Distribution of Cloud-to-Ground Lightning** Tamara L. Parsons,2000-03-01 This research effort attempted to quantify what constitutes a safe distance when lightning is present. The method used in this research project groups lightning flashes into clusters using spatial and temporal constraints. However, not all flashes meet the time and distance criteria for clustering and remained outside of tile grouped flashes and as such are identified as isolated flashes. These isolated flashes are outliers in the data set, but are precisely the flashes that prove most dangerous. For this reason not only were the distances between each flash and cluster center studied, but also the distances between each isolated flash and its nearest neighboring flash. Distributions for both distances were studied for the continental U.S. by season. A common safety radius is 5 nautical miles, just less than 9.5 km. For all regions, anywhere from 16% to 35% clustered flashes occurred beyond 9.5 km from the cluster center and 71% to 81% of the isolated flashes occurred at distances beyond 9.5 km from the nearest flash. Cumulative frequency distributions of historical lightning data can be used to find the probability of having lightning at a particular distance. In this way an acceptable level of risk can be determined and then a safe distance found.

**Determining Distance to Lightning Strokes from a Single Station ...** Lothar H. Ruhnke,1971

*A Three-station Lightning Detection System* Lothar H. Ruhnke,1972 A three-station network is described which senses magnetic and electric fields of lightning. Directional and distance information derived from the data are used to redundantly determine lightning position. This redundancy is used to correct consistent propagation errors. A comparison is made of the relative accuracy of VLF direction finders with a newer method to determine distance to and location of lightning by the ratio of magnetic-to-electric field as observed at 400 Hz. It was found that VLF direction finders can determine lightning positions with only one-half the accuracy of the method that uses the ratio of magnetic-to-electric field.

**A Comparison of Horizontal Cloud-to-Ground Lightning Flash Distance Using Weather Surveillance Radar and the Distance Between Successive Flashes Method** Christopher Cox,1999-03-01 On April 29th, 1996 an airman servicing a C-130 aircraft on Huriburt AFB Florida was struck and killed by a lightning flash that traveled an estimated 7 to 10 miles from storms south of the airfield. Ten other workers were injured in the incident. The fatal flash occurred just 8 minutes after the base weather station allowed a lightning advisory to expire. The incident brought to question the adequacy of lightning advisory criteria. Very little research has been done on the horizontal distance that cloud-to-ground lightning flashes occurs from the center of a thunderstorm. This thesis used the WSR-88D method, which used the WSR-88D Algorithm Testing And Display System (WATADS) to calculate the distance from a lightning flash to a thunderstorm centroid. The WSR-88D method was compare with a lightning spatial and temporal clustering method known as the Distance Between Successive Flashes (DBSF) method. This method can use enormous amounts of lightning data, and is well suited to accomplish a climatology of horizontal flash distance from a lightning centroid. For the combined April and July 1996 data used in this thesis, the average percentage of lightning flashes that occurred beyond the 5 nautical niile lightning safety radius outlined in AFOSH 91-100 for both the WSR-88D method and the DBSF method was 30.86%. This result questions the adequacy of the 5 nautical mile lightning safety distance criterion currently being used at most United States Air Force Bases for protection both life and property.

*Lightning* Vladimir A. Rakov,Martin A. Uman,2007-01-08 Lightning: Physics and Effects is the first book that covers essentially all aspects of lightning, including lightning physics, lightning protection and the interaction of lightning with a variety of objects and systems as well as with the environment. It is written in a style that will be accessible to the technical non-expert and is addressed to anyone interested in lightning and its effects. This will include physicists, engineers working in the power, communications, computer and aviation industries, meteorologists, atmospheric chemists, foresters, ecologists, physicians working in the area of electrical trauma and architects. This comprehensive reference volume contains over 300 illustrations, 70 tables containing quantitative information and a bibliography of more than 6000 references.

*The Lightning Flash* Vernon Cooray,2003 This unique book provides the reader with a thorough background in almost every aspect of lightning and its impact on electrical and electronic equipment. The contents range from basic discharge processes in air through transient electromagnetic field generation and interaction with overhead lines and underground cables, to lightning protection and testing techniques. This book is of value to anyone designing, installing or commissioning equipment which needs to be secured against lightning strikes, as well as being a sound introduction to research students working in the field.

*The Horizontal Extent of Lightning Based on Altitude and Atmospheric Temperature* David R. Vollmer,2002-03 Lightning poses a threat to

aircraft in flight. To mitigate this threat, the U.S. Air Force requested a study of lightning distances. Three- Dimensional lightning data were examined for this study, spanning 1 March 1997 to 31 May 2001 and obtained from the Lightning Detection and Ranging System (LDAR) at the Kennedy Space Center, FL. The LDAR data points were first grouped into lightning flashes and branches using spatial and temporal criteria. Rawinsonde data were vertically interpolated to determine the temperature at the flash source point and each branch end point. The horizontal distance from flash sources to branch end was calculated. Percentiles of branch distance were examined as a function of altitude and temperature of the flash source and branch end points. The longest 99th percentile of branch distance (35 to 40 km) was found at 2 to 7 km altitude and between 10 and -20C. The altitude range of the longest branches remained similar by season, but the longest branches were found in the winter and spring months, with summer and autumn distances shorter by 5 to 10 km. Summer results showed longer branch distances to the south and the winter data showed a significant elongation to the north.

The Nature of Ball Lightning Stanley Singer, 2012-12-06 In 1837 a comprehensive discussion of lightning appeared in the Annual of the French Bureau des Longitudes with a section on ball lightning which provided for the first time a readily available source in the scientific literature of the basic properties of this curious natural phenomenon. The author, Francois Arago, was the dominant influence in the French Academy of Sciences in the nineteenth century, having become a member of that august body at the age of twenty-three. His attention alone doubtless served at that time to establish the validity of scientific interest in the problem. In addition his discussion covered some of the major questions associated with ball lightning in a notably clear-sighted, effective style. Later reconsideration of the same questions often provided no significant improvement over Arago's discussion. There followed a dauntless band of varying but always small number who attempted to account for an apparently simple natural occurrence, a ball of fire usually seen in thunderstorms, with the best knowledge that advancing science could provide. All attempts to deal with this phenomenon were in variably frustrated. The characteristics of ball lightning could be readily cataloged, but they firmly resisted both experimental reproduction and theoretical explanation. One may say that to this day there is no explanation accepted by a large number of scientists. Several investigators of great ability and considerable accomplishment in different fields of science, including Faraday, Kelvin, and Arrhenius, took note of the problem.

**Lightning** John Hamilton, 2010-09-01 Discusses the nature, causes, and dangers of lightning, lightning strikes of the past, and ways to survive.

**Lightning Electromagnetics** Robert Gardner, 2017-11-22 A survey of theoretical and experimental research, this book covers all areas of lightning phenomenology. The four sections cover models of fundamental lightning processes, propagation of lightning-induced signals, measurement of lightning parameters, and lightning interaction with systems. The book provides an excellent review of the use of models to support remote sensing efforts. It includes data on high-frequency radiated fields for lightning and an overview of the data available in the frequency and time domains for lightning. The book also presents spectral and temporal characteristics of lightning in the VHF-UHF frequency range and uses photographic and electromagnetic measurements to examine how lightning chooses a strike point.
