Registries for Evaluating Patient Outcomes Agency for Healthcare Research and Quality/AHRQ, 2014-04-01 This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health

services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DEcIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.

Managing Information Risks William Saffady, 2020-10-28 *Managing Information Risks: Threats, Vulnerabilities, and Responses* identifies and categorizes risks related to creation, collection, storage, retention, retrieval, disclosure and ownership of information in organizations of all types and sizes. It is intended for risk managers, information governance specialists, compliance officers, attorneys, records managers, archivists, and other decision-makers, managers, and analysts who are responsible for risk management initiatives related to their organizations' information assets. An opening chapter defines and discusses risk terminology and concepts that are essential for understanding, assessing, and controlling

information risk. Subsequent chapters provide detailed explanations of specific threats to an organization's information assets, an assessment of vulnerabilities that the threats can exploit, and a review of available options to address the threats and their associated vulnerabilities. Applicable laws, regulations, and standards are cited at appropriate points in the text. Each chapter includes extensive endnotes that support specific points and provide suggestions for further reading. While the book is grounded in scholarship, the treatment is practical rather than theoretical. Each chapter focuses on knowledge and recommendations that readers can use to: heighten risk awareness within their organizations, identify threats and their associated consequences, assess vulnerabilities, evaluate risk mitigation options, define risk-related responsibilities, and align information-related initiatives and activities with their organizations' risk management strategies and policies. Compared to other works, this book deals with a broader range of information risks and draws on ideas from a greater variety of disciplines, including business process management, law, financial analysis, records management, information science, and archival administration. Most books on this topic associate information risk with digital data, information technology, and cyber security. This book covers risks to information of any type in any format, including paper and photographic records as well as digital content.

Care Without Coverage Institute of Medicine, Board on Health Care Services, Committee on the Consequences of Uninsurance, 2002-06-20 Many Americans believe that people who lack health insurance somehow get the care they really need. *Care Without Coverage* examines the real consequences for adults who lack health insurance. The study presents findings in the areas of prevention and screening, cancer, chronic illness, hospital-based care, and general health status. The committee looked at the consequences of being uninsured for people suffering from cancer, diabetes, HIV infection and AIDS, heart and kidney disease, mental illness, traumatic injuries, and heart attacks. It focused on the roughly 30 million-one in seven-working-age Americans without health insurance. This group does not include the population over 65 that is covered by Medicare or the nearly 10 million children who are uninsured in this country. The main findings of the report are that working-age Americans without health insurance are more likely to receive too little medical care and receive it too late; be sicker and die sooner; and receive poorer care when they are in the hospital, even for acute situations like a motor vehicle crash.

The Global Findex Database 2017 Asli Demirguc-Kunt, Leora Klapper, Dorothe Singer, Saniya Ansar, 2018-04-19 In 2011 the World Bank—with funding from the Bill and Melinda Gates Foundation—launched the Global Findex database, the world's most comprehensive data set on how adults save, borrow, make payments, and manage risk. Drawing on survey data collected in collaboration with Gallup, Inc., the Global Findex database covers more than 140 economies around the world. The initial survey round was followed by a second one in 2014 and by a third in 2017. Compiled using nationally representative surveys of more than 150,000 adults age 15 and above in over 140 economies, The Global Findex Database 2017: Measuring Financial Inclusion and the Fintech Revolution includes updated indicators on access to and use of formal and informal financial services. It has additional data on the use of financial technology (or fintech), including the use of mobile phones and the Internet to conduct financial transactions. The data reveal opportunities to expand access to financial services among people who do not have an account—the unbanked—as well as to promote greater use of digital financial services among those who do have an account. The Global Findex database has become a mainstay of global efforts to promote financial inclusion. In addition to being widely cited by scholars and development practitioners, Global Findex data are used to track progress toward the World Bank goal of Universal Financial Access by 2020 and the United Nations Sustainable Development Goals. The database, the full text of the report, and the underlying country-level data for all figures—along with the questionnaire, the survey methodology, and

other relevant materials—are available at www.worldbank.org/globalindex.
