Geospatial Approaches to Energy Balance and Breast Cancer David Berrigan,Nathan A. Berger,2019-07-15 Cancer occurs in specific places and spaces, each of which have identifiable geographic coordinates, characterized by unique natural, built and social characteristics, all of which contribute significantly to cancer across the spectrum from etiology through diagnosis, treatment and outcomes. In the first volume of this series, published in 2010, a single chapter was focused on these geographic influences. Since then, the field of geospatial studies of cancer prevention and control has exploded in approaches and applications. Accordingly, this volume focuses on what has now become a very specific research endeavor, Geospatial Factors Impacting Breast Cancer. The book provides important insights into this relatively new and rapidly developing field. It should be of value to all students of the Energy Balance & Cancer Series and a wide-ranging introduction to problems in cancer prevention and control for geographers, demographers and other researchers with a geospatial perspective. Moreover, it provides important information for all oncologists, endocrinologists, and behavioral modification professionals to better understand their patients in the context of their environment. It should also provide important considerations for physicians, scientists, public health professionals and disparity investigator planning clinical trials, community interventions and community planning.

The Death of Expertise Tom Nichols,2024 In the early 1990s, a small group of AIDS denialists, including a University of California professor named Peter Duesberg, argued against virtually the entire medical establishment's consensus that the human immunodeficiency virus (HIV) was the cause of Acquired Immune Deficiency Syndrome. Science thrives on such counterintuitive challenges, but there was no evidence for Duesberg's beliefs, which turned out to be baseless. Once researchers found HIV, doctors and public health officials were able to save countless lives through measures aimed at preventing its transmission--

Statistical Rethinking Richard McElreath,2018-01-03 Statistical Rethinking: A Bayesian Course with Examples in R and Stan builds readers' knowledge of and confidence in statistical modeling. Reflecting the need for even minor programming in today's model-based statistics, the book pushes readers to perform step-by-step calculations that are usually automated. This unique computational approach ensures that readers understand enough of the details to make reasonable choices and interpretations in their own modeling work. The text presents generalized linear multilevel models from a Bayesian perspective, relying on a simple logical interpretation of Bayesian probability and maximum entropy. It covers from the basics of regression to multilevel models. The author also discusses measurement error, missing data, and Gaussian process models for spatial and network autocorrelation. By using complete R code examples throughout, this book provides a practical foundation for performing statistical inference. Designed for both PhD students and seasoned professionals in the natural and social sciences, it prepares them for more advanced or specialized statistical modeling. Web Resource The book is accompanied by an R package (rethinking) that is available on the author's website and GitHub. The two core functions (map and map2stan) of this package allow a variety of statistical models to be constructed from standard model formulas.
