Electrical Drives for Direct Drive Renewable Energy Systems Markus Mueller,Henk Polinder,2013-03-25 Wind turbine gearboxes present major reliability issues, leading to great interest in the current development of gearless direct-drive wind energy systems. Offering high reliability, high efficiency and low maintenance, developments in these direct-drive systems point the way to the next generation of wind power, and Electrical drives for direct drive renewable energy systems is an authoritative guide to their design, development and operation. Part one outlines electrical drive

technology, beginning with an overview of electrical generators for direct drive systems. Principles of electrical design for permanent magnet generators are discussed, followed by electrical, thermal and structural generator design and systems integration. A review of power electronic converter technology and power electronic converter systems for direct drive renewable energy applications is then conducted. Part two then focuses on wind and marine applications, beginning with a commercial overview of wind turbine drive systems and an introduction to direct drive wave energy conversion systems. The commercial application of these technologies is investigated via case studies on the permanent magnet direct drive generator in the Zephyros wind turbine, and the Archimedes Wave Swing (AWS) direct drive wave energy pilot plant. Finally, the book concludes by exploring the application of high-temperature superconducting machines to direct drive renewable energy systems. With its distinguished editors and international team of expert contributors, Electrical drives for direct drive renewable energy systems provides a comprehensive review of key technologies for anyone involved with or interested in the design, construction, operation, development and optimisation of direct drive wind and marine energy systems. Windpower Ownership in Sweden Tore Wizelius, 2014-06-20 Windpower is a modular technology, and compared to most other power plants also rather small scale. Wind turbines are installed to the distribution grid, which is called distributed generation. Ownership and revenues can be distributed as well, using the right ownership models. Several different ownership models, used in different countries, like windpower cooperatives, local limited companies, net-accounting models etc. are described. These models can be used to make windpower become community power, and/or consumer owned power, and produce power for these owners at cost price. To wait for the international community to agree on international treaties to create a renewable energy system, takes too long. The climate disaster will inevitably happen. To speed up the transition to a renewable energy system, development has to come from below, from local communities, which can initiate and invest in windpower and other renewables. At the same time to get off from the oligopolistic electric power market and produce power at cost price is a good business.

Electrical Energy Generation in Europe Jorge Morales Pedraza, 2015-04-21 The present book maximizes reader insights into the current and future roles to be played by different types of renewable energy sources and nuclear energy for the purpose of electricity generation in the European region as a whole and in a select group of European countries specifically. This book includes detailed analysis of the different types of renewable energy sources

available in different European countries; the pros and cons of the use of the different types of renewables and nuclear energy for electricity generation; which energy options are available in the different European countries to expand their energy sector in the coming years; the impact on the climate and the environment; levels of production and consumption and the level of electricity generated by these energy sources, amongst others. Designed to inform government officials, economists, scientists and the private and public power industry of the key issues surrounding the future role of different renewable energy sources and nuclear energy in the production of electricity within the European region, this book will also describe in detail the evolution of the electrical energy sector in the chosen European region and the problems that several countries are now experiencing in the face of increasing demand for electricity.

Renewable Energy Roland Wengenmayr, Thomas Bührke, 2013-02-11 In the years since the publication of the first edition of this book, the world has undergone drastic changes in terms of energy sources. This is reflected in the expansion of this second edition from 20 to 26 chapters. The most dramatic occurrence was the Tsunami which struck Japan in March of 2011 and set off a reactor catastrophe at the nuclear power plants in Fukushima. On the other hand fossil fuel technology drives the climate change to a threatening level. So, renewable energy sources are essential for the 21st century. The increasing number of wind power plants, solar collectors and

photovoltaic installations demonstrates perceptibly that many innovations for tapping renewable energy sources have matured: very few other technologies have developed so dynamically in the past years. Nearly all the chapters were written by professionals in the respective fields. That makes this book an especially valuable and reliable source of information. The second edition is extended by several new chapters such as tidal power stations, the Desertec project, thermography of buildings and more. Furthermore, the critical debate about current first generation bio-fuels is carefully reflected, and the book presents promising solutions that do not trade in food for fuel. The editors are experienced journalists and illustrate the text with simple diagrams and information boxes, printed in full-color throughout. A valuable resource for applied physicists, engineers in power technology, engineers, and anyone interested in natural sciences.

EU Energy Security in the Gas Sector Filippou Proedrou, 2016-04-22 This book fills an important gap in the literature on energy security in the gas sector in the European Union. Whilst the emphasis is often on energy security in the oil sector, the gas sector has grown in importance in recent decades, with increasing liberalization raising critical questions for the security of gas supplies. The share of gas in Europe's energy mix is rising and the

differences between the politics and economics of gas and oil supply are becoming more pronounced. The author sheds light on the state of EU energy security in the gas sector, its interdependence with external suppliers and the current gas strategy. He examines the role of energy companies, EU member-states and EU institutions, locates the main developments in the gas sector and focuses on the principal challenges posed by such fundamental changes. The author scrutinizes the EU's relations with its main gas supplier, Russia, as well as with alternative suppliers, elaborates on the key infrastructure projects on the table and their principal ramifications, and discusses the main policies that member-states pursue to achieve energy security as well as the EU's internal contradictions. The book concludes with policy recommendations, particularly in the light of tougher environmental regulation.

The realisation of offshore wind park projects in Germany - political environment, legal framework and bankability implications Steffen Blomberg, 2014-02-01 According to the German government's new energy concept that was recently introduced, renewable energies shall replace fossil and nuclear energy sources step-by-step. The offshore wind energy sector plays a key role in this new energy strategy, and shall contribute the major share of renewable energy to the future German energy mix. The purpose of this study is to examine and evaluate the applicable conditions that have to be considered by project developers and investors when realising an offshore

wind park project in Germany. Firstly, it analyses the political environment for the offshore wind energy sector in Germany. Secondly, it gives an overview of the most relevant German legal statutes determining, inter alia, the establishment of wind energy priority areas, the applicable German feed-in tariff scheme, and the necessary approval process for offshore wind parks to be erected in the German exclusive economic zone. Thirdly, those potential bankability issues and financing challenges are discussed that an offshore wind park project planner might be exposed to when trying to secure a debt financing for such a sophisticated and capital-intensive project.

Wind Energy Handbook Tony Burton, Nick Jenkins, David Sharpe, Ervin Bossanyi, 2011-06-13 Named as one of Choice's Outstanding Academic Titles of 2012 Every year, Choice subject editors recognise the most significant print and electronic works reviewed in Choice during the previous calendar year. Appearing annually in Choice's January issue, this prestigious list of publications reflects the best in scholarly titles and attracts extraordinary attention from the academic library community. The authoritative reference on wind energy, now fully revised and updated to include offshore wind power A decade on from its first release, the Wind Energy Handbook, Second Edition, reflects the advances in technology underpinning the continued expansion of the global wind power sector. Harnessing their collective industrial and academic expertise, the authors provide a comprehensive introduction to wind turbine design and wind farm planning for onshore and offshore wind-powered

electricity generation. The major change since the first edition is the addition of a new chapter on offshore wind turbines and offshore wind farm development. Opening with a survey of the present state of offshore wind farm development, the chapter goes on to consider resource assessment and array losses. Then wave loading on support structures is examined in depth, including wind and wave load combinations and descriptions of applicable wave theories. After sections covering optimum machine size and offshore turbine reliability, the different types of support structure deployed to date are described in turn, with emphasis on monopiles, including fatigue analysis in the frequency domain. Final sections examine the assessment of environmental impacts and the design of the power collection and transmission cable network. New coverage features: turbulence models updated to reflect the latest design standards, including an introduction to the Mann turbulence model extended treatment of horizontal axis wind turbines aerodynamics, now including a survey of wind turbine aerofoils, dynamic stall and computational fluid dynamics developments in turbine design codes techniques for extrapolating extreme loads from simulation results an introduction to the NREL cost model comparison of options for variable speed operation in-depth treatment of individual blade pitch control grid code requirements and the principles governing the connection of large wind farms to transmission networks four pages of full-colour pictures that illustrate blade manufacture, turbine construction and offshore support structure installation

Firmly established as an essential reference, Wind Energy Handbook, Second Edition will prove a real asset to engineers, turbine designers and wind energy consultants both in industry and research. Advanced engineering students and new entrants to the wind energy sector will also find it an invaluable resource.

Wind Energy Essentials Richard P. Walker, Andrew Swift, 2015-04-27 Examines the possible societal impacts of wind energy projects and explains the potential issues faced when siting, constructing, and operating a wind energy project. This book begins with a history of wind power and the social impacts of both electricity and wind power from a historical perspective, a discussion of basic electrical terms, and a primer on the conversion of power in the wind to electricity. Much of the second half of the book is devoted to comparing wind energy to other forms of electric generation, both renewable and non-renewable sources. In order to have a true understanding of the impact of wind energy on society, one also has to have a thorough understanding of the impacts that other sources of electric generation have, such as fossil-fuelled plants or nuclear power plants. The comparison of electric generation sources includes a review of how such sources are typically utilized within the electric system, as well as the economic factors and environmental considerations that affect which resources utilities or operators of electric grids have to take into account. The authors conclude with a discussion of energy policies in the U.S., individual

states, and foreign nations, how these policies influence the use of renewable energy, and what our future may hold in terms of energy supply and demand. Some highlights of this book are: Discusses the wind energy impacts on the environment, local economy, electric utilities, individuals and communities Provides a visual explanation of wind energy principles through tables, graphs, maps, illustrations and photographs Offers a comprehensive overview of the issues associated with the creation and use of wind energy Models chapters around an existing university curriculum Spanning the broad range of environmental, financial, policy and other topics that define and determine the relationships between wind energy technology and our energy-dependent society, Wind Energy Essentials is a resource for students, universities, and the entire wind energy industry.

Energy and Transport in Green Transition Atle Midttun, Nina Witoszek, 2015-06-26 This book breaks new ground in the studies of green transition. It frames the ongoing transformation in terms of a battle of modernities with the emerging vision of ecomodernity as the final destination. It also offers a systematic exploration of the potential for extensive transformation of carbon-intensive sectors – with a focus on energy and transport – towards a low or post-carbon economy. The book does so in a comparative perspective, by pointing to a diversity of techno-economic and institutional solutions in the mature Western economies, and in the rapidly growing East and developing South. The contributors highlight a broad

spectrum of available alternatives as well as illuminate conflicting interests involved. They also demonstrate how solutions to the climate challenge require parallel technological and governance innovation. The book advocates a new, overarching vision and agenda of ecomodernity – based on a synergistic paradigm-shift in industry, politics and culture – to trigger and sustain the ecological innovation necessary to tip development in a green direction. This vision cannot be monolithic; rather, it should reflect the diverse interests and conditions of the global population. This book is aimed at researchers and postgraduate students of energy, transport, environmental and climate policies, as well as development, environment, innovation and sustainability.

Clean Disruption of Energy and Transportation Tony Seba, 2014-06-27 The industrial age of energy and transportation will be over by 2030. Maybe before. Exponentially improving technologies such as solar, electric vehicles, and autonomous (self-driving) cars will disrupt and sweep away the energy and transportation industries as we know it. The same Silicon Valley ecosystem that created bit-based technologies that have disrupted atom-based industries is now creating bit- and electron-based technologies that will disrupt atom-based energy industries. Clean Disruption projections (based on technology cost curves, business model innovation as well as product innovation) show that by 2030: - All new energy will be provided by solar or wind. - All new mass-market vehicles will be electric. - All of these

vehicles will be autonomous (self-driving) or semi-autonomous. - The new car market will shrink by 80%. - Even assuming that EVs don't kill the gasoline car by 2030, the self-driving car will shrink the new car market by 80%. - Gasoline will be obsolete. Nuclear is already obsolete. - Up to 80% of highways will be redundant. - Up to 80% of parking spaces will be redundant. - The concept of individual car ownership will be obsolete. - The Car Insurance industry will be disrupted. The Stone Age did not end because we ran out of rocks. It ended because a disruptive technology ushered in the Bronze Age. The era of centralized, command-and-control, extraction-resource-based energy sources (oil, gas, coal and nuclear) will not end because we run out of petroleum, natural gas, coal, or uranium. It will end because these energy sources, the business models they employ, and the products that sustain them will be disrupted by superior technologies, product architectures, and business models. This is a technology-based disruption reminiscent of how the cell phone, Internet, and personal computer swept away industries such as landline telephony, publishing, and mainframe computers. Just like those technology disruptions flipped the architecture of information and brought abundant, cheap and participatory information, the clean disruption will flip the architecture of energy and bring abundant, cheap and participatory energy. Just like those previous technology disruptions, the Clean Disruption is inevitable and it will be swift.

Pure Power - wind energy targets for 2020 and 2030 ,2011

Learning from Wind Power Joseph Szarka, Richard Cowell, Geraint Ellis, Peter A. Strachan, Charles Warren, 2012-06-14 Bringing together contributions from leading researchers, this volume reflects on the political, institutional and social factors that have shaped the recent expansion of wind energy, and to consider what lessons this experience may provide for the future expansion of other renewable technologies.

Wind Power Politics and Policy Scott V. Valentine, 2014 The wind power development policy community faces a conundrum. On the one hand, as the most commercially viable form of utility-scale renewable energy, the wind power industry has experienced in excess of ten-fold growth in total installed capacity over the past decade. On the other hand, installed wind power capacity still accounts for less than 2% of global electricity-generation capacity, despite the prevalence of studies indicating that, in certain situations, wind power can be a cheaper form of electricity than most fossil fuel alternatives. Accordingly, the most puzzling aspect of wind power development policy can be summed up in the following manner: given the global imperative to facilitate an expedient transition away from CO₂-intensive energy technologies and the commercial viability of wind power, what is stopping the wind power industry from capturing higher market shares around the world? In *Wind Power Politics and Policy*, Scott Valentine examines this question from two angles. First, it presents an analysis of social, technical, economic and political (STEP) barriers which research shows tends

to stymie wind power development. Case studies which examine phlegmatic wind power development in Japan, Taiwan, Australia and Canada are presented in order to demonstrate to the reader how these barriers manifest themselves in practice. Second, the book presents an analysis of STEP catalysts which have been linked to successful growth of wind power capacity in select nations. Four more case studies that examine the successful development of wind power in Denmark, Germany, the USA and China are put forth as practical examples of how supportive factors conflate to produce conditions that are conducive to growth of wind power markets. By examining its impediments and catalysts, the book will provide policymakers with insight into the types of factors that must be effectively managed in order to maximize wind power development.

The European Integration of RES-E Promotion Marco Wedel, 2016-02-20 By using the example of Germany and Poland this multi-level policy dependency analysis by Marco Wedel researches constraints and dependencies of the European Integration of the promotion of renewable energy source electricity (RES-E). To gain insightful results, the author does not only take a look at the implementation effectiveness of the relevant Directive 2009/28/EC, but much more generally analyses the potentially conflicting polity implications of the entities involved, as well as their respective policy preferences and processes in light of RES-(E). Combined, these give rise to multi-level constraints and dependencies for the European Integration of RES-(E)

promotion.

Wind Power Ben Backwell, 2014-09-23 *Wind Power – The Struggle for Control of a New Global Industry* looks at the nations, companies and people fighting for control of one of the world's fastest growing new industries and how we can harness one of the planet's most powerful energy resources – wind power. The book also examines the challenges the sector faces as it competes for influence and investment with the fossil fuel industry across the globe. The wind power business has grown from a niche sector within the energy industry to a global industry attracting substantial investment in recent years. In Europe wind has become the biggest source of new power generation capacity, while wind is successfully competing with the gas, coal and nuclear sectors in China and the US. The specialist wind turbine companies that pioneered the business have gone global over the last decade, while big industrial conglomerates have entered the fray. European companies are struggling to maintain their technological and market lead in the sector, in a three cornered battle with China and the US. Meanwhile, the industry is fighting to drive down costs in the face of a fossil fuel generation industry bolstered by the onset of cheap shale gas. And wind companies continue to wrestle with a stop-go cycle of investment across the world, with some traditional markets stuttering under the impact of the financial crisis and fiscal austerity, while new power hungry markets in Asia and South America emerge. *Wind Power – The Struggle for Control of a New Global Industry* analyses the industry

climbers, the investment trends and the technological advancements that will define the future of wind energy.
