*India and the South Asian Strategic Triangle* Ashok Kapur,2010-12-14 This book traces the triangular strategic relationship of India, Pakistan and China over the second half of the twentieth century, and shows how two enmities – Sino-Indian and Indo-Pakistani – and one friendship – Sino-Pakistani – defined the distribution of power and the patterns of relationships in a major centre of gravity of international conflict and international change. The three powers are tied to each other and their actions reflect their view of strategic and cultural problems and geopolitics in a volatile area. The book considers internal debates within the three countries; zones of conflict, including northeast and northwest south Asia, the Himalayas and the Indian Ocean; and the impact of developments in nuclear weapons and missile technology. It examines the destructive consequences of China's harsh methods in Tibet, of China's encouragement of military rather than democratic regimes in Pakistan, and of China's delay in dealing with the border disputes with India. Ashok Kapur shows how the Nehru-Chou rhetoric about peaceful co-existence affected the relationship, and how the dynamics of the relationship have changed significantly in recent years as a range of new factors - including India's increasing closeness to the United States - have moved the relationship into a new phase.

**Developments in 3D Geo-Information Sciences** Tijs Neutens,Philippe de Maeyer,2009-10-16 Realistically representing our three-dimensional world has been the subject of many (philosophical) discussions since ancient times. While the recognition of the globular shape of the Earth goes back to Pythagoras' statements of the sixth century B. C. , the two-dimensional, circular depiction of the Earth's surface has remained prevailing and also dominated the art of painting until the late Middle Ages. Given the immature technological means, objects on the Earth's surface were often represented in academic and technical disciplines by two-dimensional cross-sections oriented along combinations of three mutually perpendicular directions. As soon as computer science evolved, scientists have steadily been improving the three-dimensional representation of the Earth and developed techniques to analyze the many natural processes and phenomena taking part on its surface. Both computer aided design (CAD) and geographical information systems (GIS) have been developed in parallel during the last three decades. While the former concentrates more on the detailed design of geometric models of object shapes, the latter emphasizes the topological relationships between geographical objects and analysis of spatial patterns. Nonetheless, this distinction has become increasingly blurred and both approaches have been integrated into commercial software packages. In recent years, an active line of inquiry has emerged along the junctures of CAD and GIS, viz. 3D geoinformation science. Studies along this line have recently made

significant inroads in terms of 3D modeling and data acquisition.
