Free Flight James Fallows, 2008-11-05 The troubles of the airline system have become acute in the post-terrorist era. As the average cost of a flight has come down in the last twenty years, the airlines have survived by keeping planes full and funneling traffic through a centralized hub-and-spoke routing system. Virtually all of the technological innovation in airplanes in the last thirty years has been devoted to moving passengers more efficiently between major hubs. But what was left out of this equation was the convenience and flexibility of the average traveler. Now, because of heightened security, hours of waiting are tacked onto each trip. As James Fallows vividly explains, a technological revolution is under way that will relieve this problem. *Free Flight* features the stories of three groups who are inventing and building the future of all air travel: NASA, Cirrus Design in Duluth, Minnesota, and Eclipse Aviation in Albuquerque, New Mexico. These ventures should make it possible for more people to travel the way corporate executives have for years: in small jet planes, from the airport that's closest to their home or office directly to the airport closest to where they really want to go. This will be possible because of a product now missing from the vast array of flying devices: small, radically inexpensive jet planes, as different from airliners as personal computers are from mainframes. And, as Fallows explains in a new preface, a system that avoids the congestion of the overloaded hub system will offer advantages in speed, convenience, and especially security in the new environment of air travel.

Free Flight Douglas Terman, 1989-12 Gregory Mallen, an air force officer, was on leave in an isolated cabin in Vermont at the outbreak of an all-out nuclear war. Now, a year later, having survived the fallout, he is hunted by the new totalitarian regime as an enemy of the people. A gripping . . . superbly written (New York Times) novel for fans of Tom Clancy and Clive Cussler.

Free Flight James Fallows, 2002-09-05 A technological revolution, Fallows explains, is underway that will relieve the problems currently facing the airline industry. Featuring stories of three groups who are inventing and building the future of all air travel, the author explains that the current overloaded hub system will be replaced by a new environment of air travel. This edition features a new preface by the author.

Free Flight From Airline Hell To A New Age Of Travel James Fallows, 2001-06-20 Fallows, a correspondent for *Atlantic Monthly*, explores future trends in commercial aviation technology that may make airline travel easier and quicker than the current hub system. He focuses on three separate groups of innovators who are developing a NASA small plane research program, a small airplane with a parachute for the entire plane, and an inexpensive jet plane for air taxi services. c. National Airspace System : FAA has implemented some free flight initiatives, but challenges remain : report to Congressional requesters United States. General Accounting Office, 1998

Free Flight United States. Congress. House. Committee on Government Operations. Employment, Housing, and Aviation Subcommittee, 1997

National Airspace System free flight tools show promise, but implementation challenges remain. ,2001 To help meet the growing demand for air travel, the Federal Aviation Administration (FAA), in collaboration with the aviation community, is implementing a new approach for air traffic management known as free flight. Under this approach, FAA is moving gradually from its present use of highly structured rules and procedures for air traffic operations to a more flexible approach, which increases collaboration between FAA and the aviation community. By using a set of new automated technologies (tools) and procedures, free flight is intended to increase the capacity and efficiency of our nation's airspace system while helping to minimize delays. Two of these tools, the Traffic Management Advisor and the passive Final Approach Spacing Tool, provide controllers with a more efficient and effective means to increase the capacity of our nation's airspace system by better scheduling, sequencing, spacing, and assigning aircraft to runways. These two tools are expected to allow more aircraft to land during peak periods of traffic, thus increasing capacity and minimizing delays. Another tool, the User Request Evaluation Tool, allows controllers to make more efficient use of the existing airspace by allowing aircraft to fly optimal or more direct routes, thus helping to reduce delays at major airports. Collectively, these tools are also designed to achieve the above benefits without negatively affecting safety.

Low-speed Free-flight Stability and Drag Characteristics of Radially Vented Parachutes Sanger M. Burk,1964 A drop-test investigation has been conducted to determine the stability and drag characteristics of radially vented (duplex) parachutes. Parachutes of two different designs were tested: a large parachute with high geometric porosity and a small parachute with low geometric porosity designed for the same descent velocity with the same load. The results of the tests show that the large high-porosity duplex parachute was very stable in descent, oscillations averaging about [plus-or-minus]3.40; and the average drag coefficient based on the total canopy area and based on the fabric area alone were approximately 0.38 and 0.55, respectively. The small, low-porosity duplex parachute was also very stable in descent, oscillations averaging about [plus-or-minus]4.50; and the average drag coefficients based on the total canopy area and based on the fabric area alone were approximately 0.62 and 0.79, respectively. The oscillations for the cluster of three solid flat circular parachutes, tested for comparison purposes, were [plus-or-minus]7.10. The average drag coefficients based on the total canopy area and the fabric area alone were approximately 0.64 and 0.65, respectively.

Free-flight Investigation of the Deployment, Dynamic Stability, and Control Characteristics of a 1/12-scale Dynamic Radio-controlled Model of a Large Booster and Parawing Sanger M. Burk, 1963 An investigation has been conducted to determine the deployment, dynamic stability, and control characteristics of a parawing-rocket booster model using a radio-controlled free-flight technique. The parawing utilized folded rigid members. The results show that this deployment technique provides consistent transitions from essentially vertical descent at subsonic speeds with the parawing stowed on the booster to normal trimmed gliding flight with the parawing deployed. For the particular deployment configuration selected, a small drogue parachute was needed to hold the parawing away from the booster during deployment until the parawing was developing lift properly. In general, the flight characteristics of the model were fairly satisfactory for an unmanned vehicle although the model had a small constant-amplitude Dutch roll oscillation and some undesirable characteristics at the stall. The model was controllable by center-of-gravity movement but the response of the model appeared to be sluggish.
