*Rediscovering the World* Benjamin Hennig, 2012-12-14 'We need new maps' is the central claim made in this book. In a world increasingly influenced by human action and interaction, we still rely heavily on mapping techniques that were invented to discover unknown places and explore our physical environment. Although the traditional concept of a map is currently being revived in digital environments, the underlying mapping approaches are not capable of making the complexity of human-environment relationships fully comprehensible. Starting from how people can be put on the map in new ways, this

book outlines the development of a novel technique that stretches a map according to quantitative data, such as population. The new maps are called gridded cartograms as the method is based on a grid onto which a density-equalising cartogram technique is applied. The underlying grid ensures the preservation of an accurate geographic reference to the real world. It allows the gridded cartograms to be used as basemaps onto which other information can be mapped. This applies to any geographic information from the human and physical environment. As demonstrated through the examples presented in this book, the new maps are not limited to showing population as a defining element for the transformation, but can show any quantitative geospatial data, such as wealth, rainfall, or even the environmental conditions of the oceans. The new maps also work at various scales, from a global perspective down to the scale of urban environments. The gridded cartogram technique is proposed as a new global and local map projection that is a viable and versatile alternative to other conventional map projections. The maps based on this technique open up a wide range of potential new applications to rediscover the diverse geographies of the world. They have the potential to allow us to gain new perspectives through detailed cartographic depictions.

**The Girl from the Channel Islands** Jenny Lecoat, 2021-02-02 AN INSTANT NEW YORK TIMES BESTSELLER! A GLOBE AND MAIL BESTSELLER “Unforgettable” —Kelly Rimmer, New York Times bestselling author Inspired by true events, the riveting story of a young Jewish woman trapped on the occupied island of Jersey during World War II. Summer 1940: Hedy Bercu fled Vienna two years ago. Now she watches the skies over Jersey for German planes, convinced that an invasion is imminent. When it finally comes, there is no counterattack from Allied forces—the Channel Islands are simply not worth defending. Most islanders and occupying forces settle into an uneasy coexistence, but for Hedy, the situation is perilously different. For Hedy is Jewish—a fact that could mean deportation, or worse. With no means of escape, Hedy hides in plain sight, working as a translator for the Germans while silently working against them. She forges a tentative friendship with a sympathetic German officer who is likewise trapped by circumstance. But as the war intensifies, Hedy knows she is in greater danger each day. Soon, her survival will depend not just on her own courage but on the community she has come to cherish and a man who should be her enemy. Vividly recreating little-known events, this is an unforgettable tale of resilience and bravery, and of the extraordinary power found in quiet acts of heroism and love. “Riveting” —Karen Robards, New York Times bestselling author “Harrowing” —Noelle Salazar, bestselling author “Cinematic” —Ellen Keith, author of *The Dutch Wife* “Captivating” —Glynis Peters, author of *The Secret Orphan*

*Modeling of Atmospheric Chemistry* Guy P. Brasseur, Daniel J. Jacob, 2017-06-19 Mathematical modeling of atmospheric composition is a formidable scientific and

computational challenge. This comprehensive presentation of the modeling methods used in atmospheric chemistry focuses on both theory and practice, from the fundamental principles behind models, through to their applications in interpreting observations. An encyclopaedic coverage of methods used in atmospheric modeling, including their advantages and disadvantages, makes this a one-stop resource with a large scope. Particular emphasis is given to the mathematical formulation of chemical, radiative, and aerosol processes; advection and turbulent transport; emission and deposition processes; as well as major chapters on model evaluation and inverse modeling. The modeling of atmospheric chemistry is an intrinsically interdisciplinary endeavour, bringing together meteorology, radiative transfer, physical chemistry and biogeochemistry, making the book of value to a broad readership. Introductory chapters and a review of the relevant mathematics make this book instantly accessible to graduate students and researchers in the atmospheric sciences.
