*Cardiology Explained* Euan A. Ashley,Euan Ashley,Josef Niebauer,2004 One of the most time-consuming tasks in clinical medicine is seeking the opinions of specialist colleagues. There is a pressure not only to make referrals appropriate but also to summarize the case in the language of the specialist. This book explains basic physiologic and pathophysiologic mechanisms of cardiovascular disease in a straightforward manner, gives guidelines as to when referral is appropriate, and, uniquely, explains what the specialist is likely to do. It is ideal for any hospital doctor, generalist, or even senior medical student who may need a cardiology opinion, or for that ma.

**Progress in Catheter Ablation** Liong Bing Liem,Eugene Downar,2013-11-11 Catheter ablation is widely accepted as an effective and safe form of therapy for cardiac arrhythmia. In many instances this curative procedure is considered as the first line of therapy if not the ultimate treatment of choice. With the use of radiofrequency (RF) modality; which has revolutionized the technology from a barotraumatic, potentially injurious procedure using high voltage, direct-current (DC) shock to a safe and relatively painless one; catheter ablation procedure now carries a very low risk and is extremely effective for certain types of arrhythmia. Its efficacy rate in curing supraventricular tachycardia involving an accessory pathway or dual atrioventricular nodal pathways has been near perfect and its application for certain types of atrial and ventricular arrhythmia have also been very satisfactory. However, conventional RF ablation has several well known limitations, most notably is its ability to only produce relatively small, point lesions; rendering it effective only for an arrhythmia with a small and/or a superficial target. It was soon recognized that the technology would not likely to have significant utility in arrhythmia with a more widespread target such as atrial fibrillation or those which involve scarred and deep myocardial tissue such as ventricular tachycardia. Indeed, the application of conventional RF technology in these complex but common arrhythmia has yielded unsatisfactory results.

*Fluoroscopy Reduction Techniques for Catheter Ablation of Cardiac Arrhythmias* Mansour Razminia, MD,Paul C. Zei, MD, PhD,2019-05-01 Catheter ablation has become a widely used approach to treating various cardiac arrhythmias. Traditionally, catheter ablation procedures are guided by fluoroscopic imaging to help understand catheter position during mapping. The potentially significant exposure to radiation to the patient, physician, and staff increases risks of radiation exposure-related disease. Also, the protective lead garments worn increases risks of orthopedic injury. Current advanced electroanatomic mapping and intracardiac echocardiography technology have allowed the development of endocardial catheter ablation techniques without the use of fluoroscopy safely and effectively. A host of expert and experienced authors present a practical overview of the rationale and methodology for a low- or zero-fluoro environment in the electrophysiology lab with the critical goal of significantly reducing radiation exposure to the patient, physician, and staff. This practical guide: -Covers the entire spectrum of commonly (and less commonly) performed ablation procedures via endocardial approach. -Discusses general principles that are applicable across ICE and EAM platforms. - Will assist the electrophysiologist and their team to safely and effectively work toward the significant reduction in fluoroscopy utilization while also likely improving procedural safety, i.e., fewer complications, after the adoption of these techniques. -Includes a library of 50 videos, with 9 extended films (108 minutes) by Dr. Razminia detailing step-by-step procedures and techniques.
