George Harley

Neonatal Jaundice Firmino F. Rubaltelli, 2013-06-29 Hyperbilirubinemia of the neonate and the related risk of brain damage with consequent important alterations in motor development, particularly in sick preterm babies, remains a major problem in nurseries throughout the world. Since its introduction in the 1950's phototherapy has been used for reducing serum bilirubin concentrations in the newborn with hyperbilirubinemia; however, only recently the photoprocesses invoked by light on various substrates including bilirubin have been clarified in sufficient detail. Light treatment actually exemplifies the intimate relationship between the clinical and basic sciences: the better understanding of the mechanism of phototherapy as a result of investigations initiated in the laboratory has been extended to the bedside as new types of lamps or new schedules of treatment. As a consequence, phototherapy of hyperbilirubinemia has emerged as a well-established branch of photomedicine, based on molecular photo biology, scientific method, and creative use of physics and sophisticated electrooptical capabilities. The collaboration and exchange of information between workers in different basic and clinical disciplines is likely to stimulate a further optimization of phototherapy. The purpose of this monograph is to discuss some of the new aspects of bilirubin metabolism and phototherapeutic treatment. Bilirubin conjugation in the fetal and early neonatal life, the mechanism of bilirubin entry into the brain, the measurements of bilirubin concentration in the skin and serum bilirubin binding capacity are discussed by a number of prominent neonatologists.

Jaundice C. Goresky, 2012-12-06 Jaundice is much more than a clinical sign

of liver disease. It is also a pathophysiological disorder. Through studying it we have come to a much better understanding of how the liver functions under normal and abnormal circumstances. In spite of several important advances in this field, it has not recently been the subject of a comprehensive and interdisciplinary review. This Symposium was held in Montreal on May 31 and June 1, 1974, and the experts who participated in it came together for the purpose of reviewing the current status of Jaundice. The Editors sincerely appreciate the outstanding contribution which these experts made to the Second International Symposium of the Canadian Hepatic Foundation. They are also particularly indebted to Valerie M. Price, Executive Director, Canadian Hepatic Foundation, for her invaluable role in the preparation of this publication.

Neonatal Jaundice M Jeffrey Maisels, Jon F Watchko, 2000-08-07 Jaundice is the most common abnormal physical sign found in the new-born infant. It occurs in around two-thirds of all normal babies in the first few days of life, and can lead to toxicity of the central nervous system. In the current era of cost containment, infants are leaving hospital much earlier and as bilirubin levels are rising at the time of discharge, physicians must now follow these infants as out-patients to make sure that severe jaundice does

not occur. Neonatal Jaundice is the first complete source of current information for all physicians interested in the care of the new-born infant. When and how hyperbilirubinemia should be treated is a matter of ongoing controversy and this text presents a reasoned clinical approach to the management of the jaundiced new-born. The editors clearly describe the mechanisms, epidemiology and clinical diagnosis of the condition and review the current therapeutic options which include exchange transfusion, phototherapy and pharmacologic treatment.

Jaundice: Its Pathology and Treatment George Harley, 1863 Time being money, quite as much to the professional as it is to the mercantile man, the author has endeavoured in the accompanying monograph not only to condense his material, but to exclude the consideration of any question not directly bearing upon the pathology or treatment of jaundice; indeed, as stated in the Introduction, one of the chief objects of the author having been to point out how valuable an adjunct modern physiological, and chemical knowledge is in the diagnosis, and treatment of hepatic and pancreatic disease, he has neither dwelt on the literature nor discussed the old theories of the mechanism of jaundice, but limited himself almost entirely to a brief exposition of his own views. For the sake of brevity, he has at page 132 put into a tabular form the pathology of jaundice, according to the opinions expressed in the body of the volume.

Transcutaneous Bilirubinometry Daniele De Luca, William Engle, Greg Jackson, 2013 This book has been written to summarise the available knowledge regarding transcutaneous bilirubinometry, the first technique that allows a completely non-invasive measurement of a clinical variable. This technique led to important changes in the management of neonatal jaundice, the most common clinical condition of new-born infants world-wide. Transcutaneous bilirubinometry has its roots in the old observation that yellow skin colour is due to the deposition of bilirubin, a chromophore molecule. More recently, transcutaneous bilirubinometry has involved many disciplines; and accordingly, this book has contributions from physicists, biologists, paediatric dermatologists and neonatologists who have clinical research expertise in the field of neonatal hyperbilirubinemia. We hope that this book may prompt the advancement of research that will answer the as-yet unanswered questions, improve the reliability and usefulness of transcutaneous bilirubinometry, and respond to the clinical needs of our little patients.
