**Integrated Pest Management (IPM) Farmer Field School (FFS)** Food and Agriculture Organization of the United Nations, Directorate of Plant Protection Quarantine and Storage, Government of India, 2021-10-20 Maize is most important food crop after rice and wheat contributing towards national food security with an annual production of 28.7 million metric tonnes. The major maize producing states are Karnataka, Madhya Pradesh, Rajasthan Maharashtra and Andhra Pradesh. Maize is a relatively less water demanding crop and gives higher yield /hectare as compared to other cereals. Due to development of newer varieties which are tolerant to extreme temperatures, the area under maize cultivation is increasing in northern parts of India. In India about 15 million farmers are engaged in farming and processing of maize. The recent invasion of Fall Armyworm (FAW) is causing wide economic damage to maize farmers. The pest is new to India. Hence, it is important to understand its behaviour in the agro ecosystem and its interactions with predators, parasitoids and entomo-pathogens in diverse agro ecosystem. Thus, this illustrative guide on IPM-FFS has been developed by FAO and Directorate of Plant protection Quarantine & Storage (DPPQS), MoAFW for promoting IPM in maize cultivation with special emphasis on FAW management. This is an output of FAO's project titled, "Time critical measures to support early warning and monitoring for sustainable management of Fall Armyworm in India".

*Sustainable Pest Management in Date Palm: Current Status and Emerging Challenges* Waqas Wakil, Jose Romeno Faleiro, Thomas A. Miller, 2015-12-21 Date palm, *Phoenix dactylifera* L. (Arecales: Arecaceae), is an important palm species cultivated in the arid regions of the world since pre-historic times and traditionally associated with the life and culture of the people in the Middle-East and North Africa which are the pre-dominant date palm growing regions worldwide. The Food and Agriculture Organization of the UN estimates that there are over 100 million date palms with an annual production of over 7.5 million tonnes. A recent report on the arthropod fauna of date palm, enlists 112 species of insects and mites associated with date palm worldwide including 22 species attacking stored dates. Enhanced monoculture of date palm in several date palm growing countries coupled with climate change, unrestrained use of chemical insecticides and extensive international trade is likely to impact the pest complex and the related natural enemies in the date agro-ecosystems. In view of the importance of date palm as an emerging crop of the future and the need to develop and deploy ecologically sound and socially acceptable IPM techniques, this book aims to comprehensively address issues related to the biology and sustainable management of major insect and mite pests of date palm by assessing the current IPM strategies available, besides addressing emerging challenges and future research priorities. The issues pertaining to the role of semiochemicals in date palm IPM involving new strategies revolving around "attract and kill" and "push-pull" technologies, phytoplasmas and their insect vectors with implications for date palm, innovative methods for managing storage pests of dates and knowledge gaps in devising sustainable strategies for the management of red palm weevil, *Rhynchophorus ferrugineus* (Olivier) are also addressed

With more than 40 recognized experts, the book thoroughly details the rationale and benefits of employing an IPM plan and provides technical information on each aspect from cultural practices to choosing when and how to use chemicals. It also brings together research work on pest problems with information on the practical implementation of the tools. Case studies of successful operations are provided as well.

**Ecologically Based Integrated Pest Management** Opende Koul, Gerrit W. Cuperus, 2007 This book, intended for all those involved in studying entomology, crop protection and pest management, has 18 review chapters on topics ranging from the ecological effects of chemical control practices to the ecology of predator-prey and parasitoid-host systems.

**Biological Control in Agriculture IPM System** Marjorie Hoy, 2012-12-02 Biological Control in Agricultural IPM Systems covers the proceedings of the 1984 symposium on Biological Control in Agricultural IPM Systems, held in the Citrus Research and Education Center of the University of Florida at Lake Alfred. The symposium summarizes the status and practical use of biological control in agricultural integrated pest management (IPM) systems in the United States. The book is organized into seven parts encompassing 31 chapters that cover the biological control of arthropods, weeds, plant pathogens, and nematodes. After briefly discussing the status and issues of biological control in IPM, the book deals with the basic principles of IPM programs and their related costs, risks, and benefits in biological control. The text also describes the compatibility of plant resistance with biological control of arthropods and the chemical mediated host or prey selection behaviors of entomophagous insects attacking herbivorous insect pests. It explains the development of microbial insecticides; the genetic improvement of insect pathogens; the use of entomogenous nematodes in cryptic and soil habitats; and the techniques for integrating the influences of natural enemies into models of crop/pest systems. The fourth part of the book focuses on the biological control of weeds. The following part considers the general concepts relating to the unique characteristics of plant diseases affecting aerial plant parts. This part also examines the biological control of soil plant pathogens in IPM systems and the use of soilborne viruses, bacteriocins, and hypovirulent strains of fungi as biological control agents. The concluding parts describe the biological control of nematodes and the status and limits to biological control in selected commodity IPM systems, such as citrus, grapes, alfalfa, cotton, and soybean. Entomologists, plant pathologists, weed scientists, nematologists, toxicologists, and economists will find this book invaluable.

*Entomology and Pest Management* Larry P. Pedigo,Marlin E. Rice,2014-12-22 Pedigo and Rice expertly combine basic and applied entomology in this reader-friendly, pedagogically rich text. Assuming only a background in elementary biology, the authors present the major elements of general entomology before moving on to concepts in insect biology and ecology necessary for understanding insect pest management. Both theory and practice are emphasized as readers explore pertinent topics. The authors discuss pest-management issues—both preventive and curative—as aspects of applied ecology, with solutions considering environmental quality, profitability, and durability. Insect diagnostic boxes with detailed information on distribution, importance, appearance, and life cycles of particular species and groups appear throughout the text. Readers will come away with a comprehensive introduction to applied, sustainable pest management appropriate for whatever commodities they must handle.

Integrated Pest Management Dharam P Abrol,2013-08-28 Integrated Pest Management: Current Concepts and Ecological Perspective presents an overview of alternative measures to traditional pest management practices using biological control and biotechnology. The removal of some highly effective broad-spectrum chemicals, caused by concerns over environmental health and public safety, has resulted in the development of alternative, reduced risk crop protection products. These products, less toxic to the environment and easily integrated into biological control systems, target specific life stages or pest species. Predation — recognized as a suitable, long-term strategy — effectively suppresses pests in biotechnological control systems. Integrated Pest Management covers these topics and more. It explores the current ecological approaches in alternative solutions, such as biological control agents, parasites and predators, pathogenic microorganisms, pheromones and natural products as well as ecological approaches for managing invasive pests, rats, suppression of weeds, safety of pollinators, role of taxonomy and remote sensing in IPM and future projections of IPM. This book is a useful resource to entomologists, agronomists, horticulturists, and environmental scientists. Fills a gap in the literature by providing critical analysis of different management strategies that have a bearing on agriculture, sustainability and environmental protection Synthesizes research and practice on integrated pest management Emphasizes an overview of management strategies, with critical evaluation of each in the larger context of ecologically based pest management

Integration of Insect-Resistant Genetically Modified Crops within IPM Programs Jörg Romeis,Anthony M. Shelton,George Kennedy,2008-07-01 Insect pests remain one of the main constraints to food and fiber production worldwide despite farmers deploying a range of techniques to protect their crops. Modern pest control is guided by the principles of integrated pest management (IPM) with pest resistant germplasm being an important part of the foundation. Since 1996, when the first genetically modified (GM) insect-resistant maize variety was commercialized in the USA, the area planted to insect-resistant GM varieties has grown dramatically, representing the fastest adoption rate of any agricultural technology in human history. The goal of our book is to provide an overview on the role insect-resistant GM plants play in different crop systems worldwide. We hope that the book will contribute to a more rational debate about the role GM crops can play in IPM for food and fiber production.

Integrated Management of Insect Pests on Canola and Other Brassica Oilseed Crops Gadi V P Reddy,2017-04-26 This book comprehensively reviews current pest management practices and explores novel integrated pest management strategies in Brassica oilseed crops. It is essential reading for pest management practitioners and researchers working on pest management in canola and other Brassica crops worldwide. Canola, mustard, camelina and crambe are the most important oilseed crops in the world. Canola is the second largest oilseed crop in the world providing 13% of the world's supply. Seeds of these species commonly contain 40% or more oil and produce meals with 35 to 40% protein. However, its production has declined significantly in recent years due to insect pest problems. The canola pest complexes are responsible for high insecticide applications on canola. Many growers rely on calendar-based spraying schedules for insecticide applications. The diamondback moth *Plutella xylostella* and flea beetles *Phyllotreta* spp. (*P. cruciferae* and *P. striolata*) cause serious damage to canola. In the Northern Great Plains, USA, for instance, *P. xylostella* is now recorded everywhere that canola is grown. Severe damage to canola plants can be caused by overwintering populations of flea beetles feeding on newly emerged seedlings. Cabbage seed pod weevil (*Ceutorhynchus obstrictus*), swede midge (*Contarinia nasturtii*), and tarnished plant bug (*Lygus lineolaris*) are also severe pests on canola. Minor pests include aphids (cabbage aphid, *Brevicoryne brassicae* and turnip aphid, *Hyadaphis erysimi*) and grasshopper, *Melanoplus sanguinipes*.
