Supply Chain Planning Hans-Otto Günther, Herbert Meyr, 2009-03-05 In recent years, supply chain planning has emerged as one of the most challenging problems in the industry. As a consequence, the planning focus is shifting from the management of plant-specific operations to a holistic view of the various logistics and production stages, that is an approach in which suppliers, production plants and customers are considered as constituents of an integrated network. A major driving force behind this development lies in the globalization of the world economy, which has facilitated the co-operation between different partners working together in world-wide logistics networks. Hence, considerable cost savings can be gained from optimizing the structure and the operations of complex supply networks linking plants, suppliers, distribution centres and customers. Consequently, to improve the performance of the entire logistic chain, more sophisticated planning systems and more effective decision support are needed. Clearly, successful applications of supply chain management have driven the development of advanced planning systems (APS), which are concerned with supporting decision-making activities at the strategic, tactical and operational decision level. These software packages basically rely on the application of quantitative methods, which are used to model the underlying complex decision problems considering the limited availability of resources and the need to react on time to customer orders. The core module at the mid-term level of APS comprises operational supply chain planning. In many industries, production stages are assigned to different plants and distribution centres have been established at geographically dispersed locations.

Just-in-Time Logistics Kee-hung Lai, T.C.E. Cheng, 2016-04-22 The enduring repercussions of the Asian financial crisis in 1997, the worsening global economy following the burst of the dotcom bubbles in 2001, the financial tsunami in 2008, and the incessant rise in customer demand for better services have all contributed to shrinking profit margins for businesses around the world. To cope with these challenges, firms are discovering logistics as a competitive weapon when looking for ways to strengthen and preserve their market positions. One successful solution has been the adoption of Just-in-Time manufacturing systems, which involve many functional areas of a firm such as manufacturing, engineering, marketing, and purchasing, among others. Just-in-Time Logistics extends the JIT concept in manufacturing to business logistics, an area that has been observed to account for more than 30 per cent of sales revenue for some firms. It gives you an overview and an introduction of JIT logistics, and provides managerial insights on

how to achieve improved logistics performance in terms of cost and service enhancements. A discussion of the quality, implementation, and performance measurement issues related to the application of JIT in business logistics is also presented.
