**High-Tech LEGO Projects** Grady Koch, 2020-11-04 A collection of 16 fascinating scientific and technical projects to build with parts from the LEGO MINDSTORMS EV3 robotics set and other components. A great addition to any STEM curriculum or home library. High Tech LEGO® hijacks the MINDSTORMS® EV3 revolution, showing you how to build creative technical inventions with practical applications. You'll learn to build a dynamic array of working devices for outdoor research, home security, spycraft, and more. Among the book's 16 fascinating projects you'll find a motion-activated animal cam, a Morse code transmitter, a laser security fence, a motion-sensing radar detector, an automated insect trapper, and a heat-seeking infrared cannon. Welcome to a whole new world of building! Every project brings together science, mechanics, electronics, optics, and software to create complex instruments for studying and measuring the world around you, all while maintaining the playfulness of LEGO. Each easy-to-follow model combines illustrated instructions with step-by-step guidance on the engineering methods at play. As you build, you'll learn: Illegal modding techniques

(that may include drilling, cutting and soldering -- Shh!) Different ways to work with diode laser modules Tricks for modifying EV3 sensors and motors The joy of hacking LEGO light bricks to make a flickering fireplace How to use MINDSTORMS to build your own contraptions! Experiment on your own, and expand on your finished creations. Make a few adjustments so the Critter Cam triggers an alarm to scare away pests, or modify the Doppler radar to detect flammable gases. The possibilities are endless! REQUIREMENTS: LEGO® MINDSTORMS® EV3 Home Edition Windows Vista or higher macOS 10.14 or earlier

**The Arduino Inventor's Guide** Brian Huang,Derek Runberg,2017-05-15 With Arduino, you can build any hardware project you can imagine. This open-source platform is designed to help total beginners explore electronics, and with its easy-to-learn programming language, you can collect data about the world around you to make something truly interactive. The Arduino Inventor's Guide opens with an electronics primer filled with essential background knowledge for your DIY journey. From there, you'll learn your way around the Arduino through a classic hardware entry point—blinking LEDs. Over the

course of the book, 11 hands-on projects will teach you how to: –Build a stop light with LEDs –Display the volume in a room on a warning dial –Design and build a desktop fan –Create a robot that draws with a motor and pens –Create a servo-controlled balance beam –Build your own playable mini piano –Make a drag race timer to race toy cars against your friends Each project focuses on a new set of skills, including breadboarding circuits; reading digital and analog inputs; reading magnetic, temperature, and other sensors; controlling servos and motors; and talking to your computer and the Web with an Arduino. At the end of every project, you'll also find tips on how to use it and how to mod it with additional hardware or code. What are you waiting for? Start making, and learn the skills you need to own your technology! Uses the Arduino Uno board or SparkFun RedBoard

**Getting Started with Tiva ARM Cortex M4 Microcontrollers** Dhananjay V. Gadre,Sarthak Gupta,2017-10-16 The book presents laboratory experiments concerning ARM microcontrollers, and discusses the architecture of the Tiva Cortex-M4 ARM microcontrollers from Texas Instruments, describing various ways of programming them. Given the meager peripherals and sensors available on the kit, the authors describe the design of Padma – a circuit board with a large set of peripherals and sensors that connects to the Tiva Launchpad and exploits the Tiva microcontroller family's on-chip features. ARM microcontrollers, which are classified as 32-bit devices, are currently the most popular of all microcontrollers. They cover a wide range of applications that extend from traditional 8-bit devices to 32-bit devices. Of the various ARM subfamilies, Cortex-M4 is a middle-level microcontroller that lends itself well to data acquisition and control as well as digital signal manipulation applications.

Given the prominence of ARM microcontrollers, it is important that they should be incorporated in academic curriculums. However, there is a lack of up-to-date teaching material – textbooks and comprehensive laboratory manuals. In this book each of the microcontroller’s resources – digital input and output, timers and counters, serial communication channels, analog-to-digital conversion, interrupt structure and power management features – are addressed in a set of more than 70 experiments to help teach a full semester course on these microcontrollers. Beyond these physical interfacing exercises, it describes an inexpensive BoB (break out board) that allows students to learn how to design and build standalone projects, as well a number of illustrative projects.

*The History, Present State, and Future of Information Technology* Andrew Targowski, In Part I, Prof. Targowski takes us through the evolution of modern computing and information systems. While much of this material is familiar to those of us who have lived through these developments, it would definitely not be familiar to our children or our students. He also introduces a perspective that I found both refreshing and useful: looking at the evolution on a country by country basis. For those of us who live in the U.S., it is all too easy to imagine that evolution to be a purely local phenomenon. I found my appreciation of the truly global nature of computing expanding as he walked me through each country's contributions. In Parts II and III, constituting nearly half of the book, Targowski provides what I would describe as an in-depth case study of the challenges and successes of informatics in Poland. As he tells each story—many of which involved him personally—the reader cannot help but better

understand the close relationship between the freedoms that we in the west take for granted and the ability to produce innovations in IT. Even after Poland left the orbit of the former Soviet Union, the remaining vestiges of the old way of thinking remained a major impediment to progress. Being right and being rigorous were far less important than being in tune with the “approved” ways of thinking. There are important lessons to be learned here, particularly as we try to project how IT will evolve in rapidly developing economies such as China. But, from my experience, they apply equally well to western academia, where moving outside of preferred values and patterns of research can lead a scholar to be ignored or even disparaged. In Part IV, Targowski presents a bold, forward-looking synthesis of informatics and informing science in the future. Building upon articles recently published in *Informing Science: The International Journal of an Emerging Transdiscipline*, he presents a conceptual scheme of historical informing waves that builds upon historians such as Toynbee. He then considers how these trends will necessarily force us to rethink how we develop and apply IT. He does not steer away from the controversial. But he also provides cogent arguments for all his predictions and

recommendations.

Informing and Civilization Prof. Dr. Andrew Targowski, The aim of this book is to synthesize the role of information throughout the history of civilization's development. This will be defined through the convergence of (a) the cumulative evolution and revolution of the intellect (cognition as data, information, concepts, knowledge, and wisdom), (b) labor, and (c) politics which seek to control the

environment, society, and the world, applying culture and infrastructure as tools. Whereas researchers reveal the myriad of dimensions of the social order and its historiography, this book provides a synthesis of the relations, which is limited to information (and its informing systems) and civilization within the context of *historiosophie* (history with judgment). The method presented in this book—the architectural approach to the dynamics of civilizational development—is a new layer over the quantitative history based on statistical data. In an architectural synthesis of civilization, we seek a “big picture” of “civilization waves” in order to develop some criteria-oriented views of the world and its future predictability. To understand the crises and conflicts of civilization which are driven by technology in recent centuries, such a synthesis as well as optimism for human proactive adaptation, survival, and, development must be undertaken. This approach to civilizational development should allow humans to eventually “reinvent the future” in a continuous manner. We, in due course, should be able to predict the “rate of change” and provide “civilization bridging solutions” based on original thinking. It is important to remind ourselves that information is as old as our world (about 15 billion

years) because plants and trees and, in general, non-human nature produces all sorts of information, for example, the changing colors of plants and trees, which is associated with the different seasons. When the first living organisms appeared on our planet, they had ability to inform as well by changing forms, colors, signals and, so one. The first signs of life on our planet came into being about 3.85 billion years ago. Therefore, organism-based life on the Earth actually came to be over a period of just 130 million years. Hominids diverged from apes some 10-6 million years ago (instinct-driven info-communication, i.e., behavior less controlled by cognition), and the first humans (bipeds with large brains who could use tools and sound-driven info-communication) took form around 6-2.5 million years ago in Southeast Africa. Homo symbolicus, who could skillfully use language, appeared about 60,000 years ago. The origin of civilization some 6,000 years ago marks the beginning of the first advanced info-communication systems applied by humans, who could even record information.

**Critical Christianity** Courtney Handman, 2014-11-26 In *Critical Christianity*, Courtney Handman analyzes the complex and conflicting forms of sociality that Guhu-Samane Christians of rural Papua New Guinea privilege and celebrate as “the body of Christ.” Within Guhu-Samane churches, processes of denominational schism—long relegated to the secular study of politics or identity—are moments of critique through which Christians constitute themselves and their social worlds. Far from being a practice of individualism, Protestantism offers local people ways to make social groups sacred units of critique. Bible translation, produced by members of the Summer Institute of Linguistics, is a

crucial resource for these critical projects of religious formation. From early interaction with German Lutheran missionaries to engagements with the Summer Institute of Linguistics to the contemporary moment of conflict, Handman presents some of the many models of Christian sociality that are debated among Guhu-Samane Christians. Central to the study are Handman's rich analyses of the media through which this critical Christian sociality is practiced, including language, sound, bodily movement, and everyday objects. This original and thought-provoking book is essential reading for students and scholars of anthropology and religious studies.

**Coding the Arduino** Bob Dukish, 2018-06-13 Get started with Arduino and computer coding. This book is intended for those new to the Arduino and computer coding. and looking to gain the skills to write microcontroller programs that can act on given inputs and operate electromechanical output devices. Coding the Arduino contains four sections: background information, game development, electronic games and projects, and expanded programs. The final chapters expand on the functionality of some of the programs presented in previous chapters, and challenges you with capstone projects.

The projects will be described where the program code that is presented can be modified, or in which two or more of the sample programs may be used to synthesize a new program as the solution to the problem that is presented. Additionally, review questions are presented at the end of each chapter to test your comprehension of the material. What You'll Learn Understand basic principles of technology, and about analog and digital electronics. Create games from scratch, where you interactively play against the program. Gain an introduction to Artificial Intelligence (AI) Who This Book Is For Electronic hobbyists, makers of all levels, and teens with an interest in technology and coding who are looking to get started with Arduinos.
