Regenerative Medicine Applications in Organ Transplantation Giuseppe Orlando, 2013-10-11 Regenerative Medicine Applications in Organ Transplantation illustrates exactly how these two fields are coming together and can benefit one another. It discusses technologies being developed, methods being implemented, and which of these are the most promising. The text encompasses tissue engineering, biomaterial sciences, stem cell biology, and developmental biology, all from a transplant perspective. Organ systems considered include liver, renal, intestinal, pancreatic, and more. Leaders from both fields have contributed chapters, clearly illustrating that regenerative medicine and solid organ transplantation speak the same language and that both aim for similar medical outcomes. The overall theme of the book is to provide insight into the synergy between organ transplantation and regenerative medicine. Recent groundbreaking achievements in regenerative medicine have received unprecedented coverage by the media, fueling interest and enthusiasm in transplant clinicians and researchers. Regenerative medicine is changing the premise of solid organ transplantation, requiring transplantation investigators to become familiar with regenerative medicine investigations that can be extremely relevant to their work. Similarly, regenerative medicine investigators need to be aware of the needs of the transplant field to bring these two fields together for greater results.

Bridges the gap between regenerative medicine and solid organ transplantation and highlights reasons for collaboration Explains the importance and future potential of regenerative medicine to the transplant community Illustrates to regenerative medicine investigators the needs of the transplant discipline to drive and guide investigations in the most promising directions

Hepatocyte Transplantation S. Gupta, Peter L.M. Jansen, J. Klempnauer, M.P.

Manns,2002-09-30 In recent years there has been an increasing need for transplantation, but the number of donor livers available has increased only slightly, despite intensive public relations activities. New concepts in the field of transplantation, for instance the transplantation of living donor organs or the splitting of organs, are urgently required, to safeguard the treatment of patients with severe liver disease. The development and clinical application of cell therapy for patients with liver disease could soon present a significant enhancement of the therapeutic options. The aim of such cell therapy is to repair or improve the biological function of the chronically and acutely damaged liver. Even though systematic trials are not available, individual case reports and small series already show promising clinical results. Present concepts of cell therapy for liver diseases based on the use of primary hepatocytes have recently been considerably extended through new data on the biology of stem cells. The adult haematopoietic stem cell as a pool for hepatocyte grafts - what would be the perspectives for the clinical application? This book is the proceedings of the Falk Symposium No. 126 on 'Hepatocyte Transplantation' (Progress in Gastroenterology and Hepatology Part III) held in Hannover, Germany, October 2-3, 2001, and is a forum for basic research, but also for questions concerning clinical applications in the field of hepatocyte transplantation.

Marginal Donors Takehide Asano,Norihide Fukushima,Takashi Kenmochi,Naoto Matsuno,2014-03-17 In response to persistent donor organ shortages, organs

from marginal donors, such as expanded criteria donors (ECD) and donation after cardiac death (DCD) donors, are now accepted and have been successfully transplanted, reducing the waiting times for transplantation. Especially in Japan, transplantation of DCD kidneys has a relatively long history because of the difficulty or lack of national consensus in accepting brain death, which has made it possible to accumulate considerable clinical experience. Thus, the current organ shortage has stimulated interest in the use of marginal donors for transplantation. On the other hand, however, it is known that these organs have a high rate of delayed graft function and a more complicated postoperative course. These drawbacks have created the greatest clinical challenge in transplantation to date because of the current shortage and limitations of donors using ECD and DCD. This book, prepared by distinguished authorities in their fields, is intended for clinicians and researchers. It highlights the use of marginal donors as a comparatively novel source of transplantation organs and provides a thorough overview of marginal donors from their historical origins to recent clinical applications, including the state-of-the-art science of organ/donor management, procurement, and preservation. Also provided is valuable information on ABO-incompatible donors which extend the availability of donor sources. Each chapter offers an individual analysis of the optimal requirements for the safe management and preservation of organs, including the heart, lung, liver, kidney, pancreas, and pancreatic islets.

Split liver transplantation X. Rogiers,H. Bismuth,R.W. Busuttil,D.C. Broering,D. Azoulay,2012-12-06 Aimed at the trainee surgeon and experienced transplant surgeon, this compendium on split-liver grafting contains articles written by faculty members of the first International Course on Split-Liver Transplantation. It covers the main aspects of the field and is geared towards helping surgeons select the best surgical techniques as well as identifying the pitfalls. The text features detailed instructions on the various procedures as well as an overview of the area.

The Living Organ Donor As Patient Lainie Friedman Ross,J. Richard Thistlethwaite,2021-11-30 This is a book about living solid organ donors as patients in their own right. This book is premised on the supposition that the field of living donor organ transplantation is ethical, even if some specific applications are not. Living donor organ transplantation is controversial at its core because it exposes one patient (the living donor) to clinical risks for the clinical benefit of another (the candidate recipient). It is different than obstetrics which also involves 2 patients-a pregnant woman and her fetus-- because transplantation involves two physically individuated patients who, in most cases, individually consent to the medical interventions. And in many cases, the donor-recipient interdependence is optional because deceased donor organs may be available. So before one can begin, one must ask, even if only rhetorically: Is living donation ethical? The question is not new: one of the first to ask about the

ethics of living donor transplantation was Joseph Murray, the surgeon credited with performing the first successful living donor kidney transplant which paved the way for the broad adoption of kidney and other solid organ transplantation around the world--

Bioengineering Liver Transplantation Luc J.W. Van der Laan, Bart Spee, Monique M. A. Versteegen, 2019-11-19 The aim of this Special Issue is to review, understand, and evaluate new and exciting opportunities from the field on regenerative medicine, biomaterials, and stem cell research for the bioengineering of human liver grafts that can be applied for transplantation and personalized treatment of end-stage liver disease. The development of culture conditions for long-term expansion of LGR5+ intestinal stem cells as crypt-villus structures demonstrated the feasibility of deriving complex, organ-like structures in vitro from primary adult tissues, including the liver. Moreover, human pluripotent stem cells (hPSCs) can be applied to generate functionally matured liver and bile duct epithelial cells. In this Special Issue, we welcome reviews and original papers focussing on hepatic cell sources, including adult hepatic stem cells, organoids, fetal and induced pluripotent stem cells, and primary cells (i.e., hepatocytes, cholangiocytes, and endothelial cells) and how these cells can be applied in tissue engineering strategies to generate implantable and personalized liver grafts. Potential topics include, but are not limited to, the following: liver tissue engineering, liver regeneration, graft repair, liver stem cells

and organoids, bio-scaffolds, and 3D printing. We invite you to contribute original research papers, as well as comprehensive reviews, aligned with these themes, to advance and improve the actual state-of-the-art in liver bioengineering and providing new opportunities for the imminent medical problem of organ and tissue shortage for transplantation.
