Discovering Mathematics with Maple R.J. Stroeker,J.F. Kaashoek,1999-04-01 This unusual introduction to Maple shows readers how Maple or any other computer algebra system fits naturally into a mathematically oriented work environment. Designed for mathematicians, engineers, econometricians, and other scientists, this book shows how computer algebra can enhance their theoretical work. A CD-ROM contains all the Maple worksheets presented in the book.

Parameter Redundancy and Identifiability Diana Cole,2020-05-10 Statistical and mathematical models are defined by parameters that describe different characteristics of those models. Ideally it would be possible to find parameter estimates for every parameter in that model, but, in some cases, this is not possible. For example, two parameters that only ever appear in the model as a product could not be estimated individually; only the product can be estimated. Such a model is said to be parameter redundant, or the parameters are described as non-identifiable. This book explains why parameter redundancy and non-identifiability is a problem and the different methods that can be used for detection, including in a Bayesian context. Key features of this book: Detailed discussion of the problems caused by parameter redundancy and non-identifiability Explanation of the different general methods for detecting parameter redundancy and non-identifiability, including symbolic algebra and numerical methods Chapter on Bayesian identifiability Throughout illustrative examples are used to clearly demonstrate each problem and method. Maple and R code are available for these examples More in-depth focus on the areas of discrete and continuous state-space models and ecological statistics, including methods that have been specifically developed for each of these areas This book is designed to make parameter redundancy and non-identifiability accessible and understandable to a wide audience from masters and PhD students to researchers, from mathematicians and statisticians to practitioners using mathematical or statistical models.

MATLAB Symbolic Algebra and Calculus Tools Cesar Lopez,2014-12-19 MATLAB is a high-level language and environment for numerical computation, visualization, and programming. Using MATLAB, you can analyze data, develop algorithms, and create models and applications. The language, tools, and built-in math functions enable you to explore multiple approaches and reach a solution faster than with spreadsheets or traditional programming languages, such as C/C++ or Java. MATLAB Symbolic Algebra and Calculus Tools introduces you to the MATLAB language with practical hands-on instructions and results, allowing you to quickly achieve your goals. Starting with a look at symbolic variables and functions, you will learn how to solve equations in MATLAB, both symbolically and numerically, and how to simplify the results. Extensive coverage of polynomial solutions, inequalities and systems of equations are covered in detail. You will see how MATLAB incorporates vector, matrix and character variables, and functions thereof. MATLAB is a powerful symbolic manipulator which enables you to factorize, expand and simplify complex algebraic expressions over all common fields (including over finite fields and algebraic field extensions of the rational numbers). With MATLAB you can also work with ease in matrix algebra, making use of commands which allow you to find eigenvalues, eigenvectors, determinants, norms and various matrix decompositions, among many other features. Lastly, you will see how you can use MATLAB to explore mathematical analysis, finding limits of sequences and functions, sums of series, integrals,

derivatives and solving differential equation.

Land, Power, and Economics on the Frontier of the Upper Canada John Clarke,2001 The prevailing ideology in Ontario at the time was a conservative culture that rejected everything American and attempted to preserve the best of the British world in the new Eden. Those building the state believed that a social and political hierarchy composed of those possessing a “natural virtue” would serve society best. In consequence, a few individuals at the top of the hierarchy, through their access to power, came to control the bulk of the land, the basis of the economy. At the other end of the spectrum from the elite were those transforming the land and themselves through their own labour. How did the physical environment and government land policy affect the pattern of settlement and the choice of land for a viable farm? What was the price of land, and how common was credit? Did the presence of reserved lands hinder or promote development? How extensive was land speculation and how did it operate? Clark brings these issues and more to the forefront, integrating concepts and substantive issues through a problem-oriented approach. Blending qualitative and quantitative approaches, he weaves together surveyors' records, personal and government correspondence, assessment rolls, and land records to measure the pulse of this pre-industrial society.
