Discoveries of the Census of Marine Life Paul V. R. Snelgrove, 2010-10-07 Over the 10-year course of the recently completed Census of Marine Life, a global network of researchers in more than 80 nations has collaborated to improve our understanding of marine biodiversity - past, present, and future. Providing insight into this remarkable project, this book explains the rationale behind the Census and highlights some of its most important and dramatic findings, illustrated with full-color photographs throughout. It explores how new technologies and partnerships have contributed to greater knowledge of marine life, from unknown species and habitats, to migration routes and distribution patterns, and to a better appreciation of how the oceans are changing. Looking to the future, it identifies what needs to be done to close the remaining gaps in our knowledge and provide information that will enable us to better manage resources, conserve diversity, reverse habitat losses, and respond to global climate change.

Marine Biology For The Non-Biologist Andrew Caine, 2017-02-20 The first of two books in the series Marine Life by Andrew Caine, the second being the long awaited 'Marine Ecology for the Non-Ecologist' now available on Amazon. For years the only textbooks available for anyone who has an interest in marine biology have laid in the realms of the academic texts or identification guides for the diver, aquarium keeper, or for those exploring the seashore. Fantastic books indeed, however, there are none that bring the real biology of marine life to the general public. For the first time, this fascinating topic has been described in a way that anyone who loves the life residing in the marine environment, can not only understand but really enjoy, in an easy to read, informative text. The book describes the major groups of animals present in the sea, the soft-bodied animals the cnidarians (jellyfish anemones, corals etc.), the crustaceans, (shrimps, crabs, lobsters, etc.) the molluscs, (the shellfish and squid etc.), the echinoderms (starfish, urchin etc). Detailing their life histories, reproductive strategies, adaptations, predator avoidance and how they grab a meal, plus much more. which collectively makes them successful as a species today. Then we examine coral reef architecture, hydrothermal vent biology, life in the polar sea and marine invertebrate toxins (what's going to kill you in the sea). The book is crammed with amazing facts that make this subject such a wonderful topic to understand. Such has been the success of this publication Andrew Caine has released the second book in the series - Marine Life - Marine Ecology for the Non-Ecologist- detailing as ever, in an easy to understand manner, the different habitats found mainly around the coastline of the earth and how as species the animals described in this volume exploit each individual habitat to form the ecosystems we see today. In this book, we explore and discover what exactly ecology is, the physical aspects and biological processes of ecology. We look at the rocky coast, the sandy shore, the estuaries, the mangroves, the coral reefs, and more. Andrew Caine has managed to produce a highly readable masterpiece which takes the reader on a magical and sometimes scary journey into the world of the planet's marine life, looking at the complex ecosystems with algae, plankton, shellfish, coral reefs and even whales. Andrew describes in fascinating detail and in a humorous and light-hearted manner the secret lives of our many different sea creatures--or beasties as he likes to call them. The book is crammed full of interesting facts and is written in a straightforward way making it easy for the layman to read and understand. He delves into the lives of jellyfish, limpets, mussels and many other species, uncovering their often bizarre behaviour and sometimes scary predatory techniques and feeding habits which most ordinary people could barely imagine existed. Who would guess a whelk slowly drills into the shell of its unfortunate victims, or that some creatures harpoon their victims with poison-bearing teeth? Andrew also dispels many myths and misunderstandings. For example, that the Portuguese Man o' War is not even a jellyfish at all, but instead a colony of connected creatures! These are just some of the many fascinating facts which Andrew uncovers in his book. Throughout the book, the reader is kept entertained by Andrew's unique writing style and amusing turn of phrase. On a more serious note, Andrew also discusses the importance of coral reefs and their vital role in supporting human livelihoods. Andrew also reveals his true passion for marine biology and his deep concern that many of our species could be under threat due to overfishing of the humble krill. Andrew's work may well motivate people to take a more active interest in the study and preservation of our rich and diverse marine life.

The Marine World Frances Dipper, 2016-04-29 The marine world is an immense, three-dimensional living space inhabited by marine life that varies from the mundane to the bizarre. Its salty influence extends up river estuaries, over seashores and inland with brine-laden spray. The Marine World covers all those organisms that live in, on and around the ocean bringing together in a single text everything from the miniscule to the immense. With chapters on marine bacteria, plants, fungi and protozoa, as well as all the major groups of marine invertebrates, plus fish, reptiles, mammals and birds, it provides an insight into the existence and way of life of almost everything living in the ocean. Each animal or plant is found in its own particular place and The Marine World encompasses principal ocean habitats and ecosystems including open water, seashores, deep sea, coral reefs and many more. Written with clear, accessible text and illustrated throughout with photographs and detailed drawings, The Marine World provides in depth information to provide answers for each group on 'what?' 'where?' and 'how?', via sections on identification, distribution, structure, biology, classification and conservation.

Marine Anthropogenic Litter Melanie Bergmann, Lars Gutow, Michael Klages, 2015-06-01 This book describes how man-made litter, primarily plastic, has spread into the remotest parts of the oceans and covers all aspects of this pollution problem from the impacts on wildlife and human health to socio-economic and political issues. Marine litter is a prime threat to marine wildlife, habitats and food webs worldwide. The book illustrates how advanced technologies from deep-sea research, microbiology and mathematic modelling as well as classic beach litter counts by volunteers contributed to the broad awareness of marine litter as a problem of global significance. The authors summarise more than five decades of marine litter research, which receives growing attention after the recent discovery of great oceanic garbage patches and the ubiquity of microscopic plastic particles in marine organisms and habitats. In 16 chapters, authors from all over the world have created a universal view on the diverse field of marine litter pollution, the

biological impacts, dedicated research activities, and the various national and international legislative efforts to combat this environmental problem. They recommend future research directions necessary for a comprehensive understanding of this environmental issue and the development of efficient management strategies. This book addresses scientists, and it provides a solid knowledge base for policy makers, NGOs, and the broader public.

Review of the Marine Recreational Information Program National Academies of Sciences, Engineering, and Medicine, Division on Earth and Life Studies, Ocean Studies Board, Committee on the Review of the Marine Recreational Information Program, 2017-07-24 The National Marine Fisheries Service (NMFS) of the National Oceanic and Atmospheric Administration (NOAA) is responsible for collecting information on marine recreational angling. It does so principally through the Marine Recreational Information Program (MRIP), a survey program that consists of an in-person survey at fishing access sites and a mail survey, in addition to other complementary or alternative surveys. Data collected from anglers through MRIP supply fisheries managers with essential information for assessing fish stocks. In 2006, the National Research Council provided an evaluation of MRIP's predecessor, the Marine Recreational Fisheries Statistics Survey (MRFSS). That review, *Review of Recreational Fisheries Survey Methods*, presented conclusions and recommendations in six categories: sampling issues; statistical estimation issues; human dimensions; program management and support; communication and outreach; and general recommendations. After spending nearly a decade addressing the recommendations, NMFS requested another evaluation of its modified survey program (MRIP). This report, the result of that evaluation, serves as a 10-year progress report. It recognizes the progress that NMFS has made, including major improvements in the statistical soundness of its survey designs, and also highlights some remaining challenges and provides recommendations for addressing them.

Sustaining Life Eric Chivian, Aaron Bernstein, 2008-06-02 The Earth's biodiversity-the rich variety of life on our planet-is disappearing at an alarming rate. And while many books have focused on the expected ecological consequences, or on the aesthetic, ethical, sociological, or economic dimensions of this loss, *Sustaining Life* is the first book to examine the full range of potential threats that diminishing biodiversity poses to human health. Edited and

written by Harvard Medical School physicians Eric Chivian and Aaron Bernstein, along with more than 100 leading scientists who contributed to writing and reviewing the book, Sustaining Life presents a comprehensive--and sobering--view of how human medicines, biomedical research, the emergence and spread of infectious diseases, and the production of food, both on land and in the oceans, depend on biodiversity. The book's ten chapters cover everything from what biodiversity is and how human activity threatens it to how we as individuals can help conserve the world's richly varied biota. Seven groups of organisms, some of the most endangered on Earth, provide detailed case studies to illustrate the contributions they have already made to human medicine, and those they are expected to make if we do not drive them to extinction. Drawing on the latest research, but written in language a general reader can easily follow, Sustaining Life argues that we can no longer see ourselves as separate from the natural world, nor assume that we will not be harmed by its alteration. Our health, as the authors so vividly show, depends on the health of other species and on the vitality of natural ecosystems. With a foreword by E.O. Wilson and a prologue by Kofi Annan, and more than 200 poignant color illustrations, Sustaining Life contributes essential perspective to the debate over how humans affect biodiversity and a compelling demonstration of the human health costs. It is the winner of the Gerald L. Young Book Award in Human Ecology Best Sci-Tech Books of 2008 for Biology by Gregg Sapp of Library Journal
