Yuan, Zoom Video Communications There is much publicity regarding network security, but the real cyber Achilles' heel is insecure software. Millions of software vulnerabilities create a cyber house of cards, in which we conduct our digital lives. In response, security people build ever more elaborate cyber fortresses to protect this vulnerable software. Despite their efforts, cyber fortifications consistently fail to protect our digital treasures. Why? The security industry has failed to engage fully with the creative, innovative people who write software. Core Software Security expounds developer-centric software security, a holistic process to engage creativity for security. As long as software is developed by humans, it requires the human element to fix it. Developer-centric security is not only feasible but also cost effective and operationally relevant. The methodology builds security into software development, which lies at the heart of our cyber infrastructure. Whatever development method is employed, software must be secured at the source. The Myths of Security John Viega, 2009-06-16 If you think computer security has improved in recent years, *The Myths of Security* will shake you out of your complacency. Longtime security professional John Viega, formerly Chief Security Architect at McAfee, reports on the sorry state of the industry, and offers concrete suggestions for professionals and individuals confronting the issue. Why is security so bad? With many more people online than just a few years ago, there are more attackers -- and they're truly motivated. Attacks are sophisticated, subtle, and harder to detect than ever. But, as Viega notes, few people take the time to understand the situation and protect themselves accordingly. This book tells you: Why it's easier for bad guys to own your computer than you think Why anti-virus software doesn't work well -- and one simple way to fix it Whether Apple OS X is more secure than Windows What Windows needs to do better How to make strong authentication pervasive Why patch management is so bad Whether there's anything you can do about identity theft Five easy steps for fixing application security, and more Provocative, insightful, and always controversial, *The Myths of Security* not only addresses IT professionals who deal with security issues, but also speaks to Mac and PC users who spend time online.

**Understanding Uaps/Ufos: Implications for National Security and Air Safety** Miguel A. Moreno Ph.D., 2023-05-24 In this book, I respond to the need for explanations of UAPs/UFOs, as

presented by the Report from the Office of the Director of National Intelligence. I work within the Framework of the Pentagon's statement that UAPs are real objects with advanced intelligently controlled technologies, which are not ours (US). I present explanations of the Physics of UFOs/UAPs and how they work. I analyze and explain UAPs' flight characteristics. I present explanations for the observables listed by the National Intelligence Director's Report. I address and refute the hypothesis that UAPs are advanced hypersonic drones from Russia or China. I review and address the National Security as well as air safety concerns. I present case evidence and historical data supporting the hypothesis that some UFOs/UAPs are advanced technologies that do not seem to originate from Earth. It is evidence that may be conducive to the discovery, the realization that we are not alone in the Universe. This book is also intended to be used for additional reading in Astronomy and Physics classes.

*National Infrastructure Advisory Council Intelligence Information Sharing Final Report and*

*Recommendations* , Executive Summary The National Infrastructure Advisory Council (NIAC) set out to determine whether the right people are receiving the right intelligence information at the right time to support robust protection and resilience of the Nation's critical infrastructure. More than 200 interviews and extensive open-source research uncovered a wealth of insights on this complex problem. First, there have been marked improvements in the sharing of intelligence information within the Federal Intelligence Community, and between the Federal Government and regions, States, and municipalities. However, this level of improvement has not been matched in the sharing of intelligence information between the Federal Government and private sector owners and operators of critical infrastructure. Despite some notable successes, this bi-directional sharing is still relatively immature, leaving a large gap between current practices and an optimal system of effective public-private intelligence information sharing. We observe that trust is the essential glue to make this public-private system work. Trust results when partner capabilities are understood and valued, processes are tailored to leverage these capabilities, and these processes are tested and proven valuable to all partners. When breakdowns in information sharing occur, it erodes trust and is counterproductive to risk management. Information sharing is perhaps the most important factor in the protection and resilience of critical infrastructure. Information on threats to infrastructure and their likely impact underlies nearly every security decision made by owners and operators, including which assets to protect, how to make operations more resilient, how to plan for potential disasters, when to ramp up to higher levels of security, and how to respond in the immediate aftermath of a disaster. We looked at intelligence information flowing from the Federal Government to critical infrastructure owners and operators as well as risk information flowing from critical infrastructure owners and operators to the government. Our study reveals the complex ways information is gathered, analyzed, packaged, and shared among government and the owners and operators of critical infrastructures. In tackling this complex subject, we examined the different stages of the intelligence cycle, including requirements generation, information collection, analysis, and dissemination. To gather a variety of perspectives, we conducted extensive interviews with security directors, chief executives, subject matter experts, and government executives and managers. Recognizing that distinct sector characteristics shape information sharing needs, we conducted case studies of five sectors: Commercial Facilities, Healthcare and Public Health, Energy (Oil and Natural Gas), Banking and Finance, and Chemical. While we found some information sharing approaches to be effective, others were not. As a result, we adopted a "capability maturity approach," which acknowledges that different Federal agencies have different abilities to share information effectively, and we sought to build on what is working.
