Energy-efficient Buildings in India Mili Majumdar,2001-01-01 Accelerated urbanization imposes immense pressure on the dwindling energy sources and fragile ecosystems. Yet, the resource crunch confronting energy supplies can be alleviated if we design and develop future buildings by incorporating sound concepts of energy efficiency and sustainability.Covering 41 projects from India's various climatic zones, this book provides thorough insights into the context, techniques, and benefits of energy-efficient buildings. The projects highlight design responses to varied climatic conditions, appropriate materials and construction methods, implementation of energy-efficient systems, and effective utilization of renewable energy to reduce pressure on grid power.This book will inspire architects, designers, urban planners, engineers, and students to build for a better tomorrow.

America's Energy Future National Research Council,National Academy of Engineering,National Academy of Sciences,Division on Engineering and Physical Sciences,Committee on America's Energy Future,2010-01-15 For multi-user PDF licensing, please contact customer service. Energy touches our lives in countless ways and its costs are felt when we fill up at the gas pump, pay our home heating bills, and keep businesses both large and small running. There are long-term costs as well: to the environment, as natural resources are depleted and pollution contributes to global climate change, and to national security and independence, as many of the world's current energy sources are increasingly concentrated in geopolitically unstable regions. The country's challenge is to develop an energy portfolio that addresses these concerns while still providing sufficient, affordable energy reserves for the nation. The United States has enormous resources to put behind solutions to this energy challenge; the dilemma is to identify which solutions are the right ones. Before deciding which energy technologies to develop, and on what timeline, we need to understand them better. America's Energy Future analyzes the potential of a wide range of technologies for generation, distribution, and conservation of energy. This book considers technologies to increase energy efficiency, coal-fired power generation, nuclear power, renewable energy, oil and natural gas, and alternative transportation fuels. It offers a detailed assessment of the associated impacts and projected costs of implementing each technology and categorizes them into three time frames for implementation.

Mickey Muenning Mickey Muenning,2014-06-24 This is the first monograph featuring the work of architect Mickey Muennig. Muennig is an important proponent of organic architecture, creating highly individualized structures and spaces that express the dreams and needs of his clients, while complementing the natural environment. He has designed buildings, most notably in the Big Sur area of California's Central Coast, that blend with their surroundings, incorporate passive energy features, and utilize natural materials in original ways. Maintaining a daring balance between past and future, Muennig's unique work captures the iconoclastic spirit of Big Sur. Mickey Muennig studied architecture under Bruce Goff at the University of Oklahoma. Upon graduating, he worked on various architectural projects around the country until a fortuitous vacation to Big Sur on California's Central Coast in 1971 changed his life forever. He subsequently moved there, and has lived and worked in Big Sur ever since. Muennig was recognized by Architectural Digest as one of the top 100 architects in the United States in 2000 and 2002.

Fire, Native Peoples, and the Natural Landscape Thomas Vale, 2013-04-16 For nearly two centuries, the creation myth for the United States imagined European settlers arriving on the shores of a vast, uncharted wilderness. Over the last two decades, however, a contrary vision has emerged, one which sees the country's roots not in a state of pristine nature but rather in a human-modified landscape over which native peoples exerted vast control. *Fire, Native Peoples, and the Natural Landscape* seeks a middle ground between those conflicting paradigms, offering a critical, research-based assessment of the role of Native Americans in modifying the landscapes of pre-European America. Contributors focus on the western United States and look at the question of fire regimes, the single human impact which could have altered the environment at a broad, landscape scale, and which could have been important in almost any part of the West. Each of the seven chapters is written by a different author about a different subregion of the West, evaluating the question of whether the fire regimes extant at the time of European contact were the product of natural factors or whether ignitions by Native Americans fundamentally changed those regimes. An introductory essay offers context for the regional chapters, and a concluding section compares results from the various regions and highlights patterns both common to the West as a whole and distinctive for various parts of the western states. The final section also relates the findings to policy questions concerning the management of natural areas, particularly on federal lands, and of the naturalness of the pre-European western landscape.

Nch'i-wána, "the Big River" Eugene S. Hunn, James Selam, 1990 The mighty Columbia River cuts a deep gash through the Miocene basalts of the Columbia Plateau, coursing as well through the lives of the Indians who live along its banks. Known to these people as Nch'i-Wana (the Big River), it forms the spine of their land, the core of their habitat. At the turn of the century, the Sahaptin speakers of the mid-Columbia lived in an area between Celilo Falls and Priest Rapids in eastern Oregon and Washington. They were hunters and gatherers who survived by virtue of a detailed, encyclopedic knowledge of their environment. Eugene Hunn's authoritative study focuses on Sahaptin ethnobiology and the role of the natural environment in the lives and beliefs of their descendants who live on or near the Yakima, Umatilla, and Warm Springs reservations.

Refract House Ila Leslie Berman, Nataly Gattegno, 2011 *Refract House*, a joint endeavor of the Division of Architecture at California College of the Arts and the School of Engineering at Santa Clara University, is a full-scale working prototype of a prefabricated

solar-powered home, with a sophisticated sensor-informed energy production and distribution system and an innovative thermal building skin -- Introduction.

Forgotten Fires Omer Call Stewart, 2002 A common stereotype about American Indians is that for centuries they lived in static harmony with nature, in a pristine wilderness that remained unchanged until European colonization. Omer C. Stewart was one of the first anthropologists to recognize that Native Americans made significant impact across a wide range of environments. Most important, they regularly used fire to manage plant communities and associated animal species through varied and localized habitat burning. In *Forgotten Fires*, editors Henry T. Lewis and M. Kat Anderson present Stewart's original research and insights, written in the 1950s yet still provocative today. Significant portions of Stewart's text have not been available until now, and Lewis and Anderson set Stewart's findings in the context of current knowledge about Native hunter-gatherers and their uses of fire.

The Earth-sheltered Solar Greenhouse Book Mike Oehler, 2007 The Earth-Sheltered Solar Greenhouse Book is the first to promote the benefits of both passive solar energy and earth sheltering in greenhouse design. This combination results in greenhouses which need no additional heating. The captured sun's energy and that which is stored in the earth is enough for successful year round harvest. It takes you step by step through the construction of an inexpensive greenhouse which may be built with either newly purchased or salvaged building materials for pennies on the dollar. It explains the author's unique Post/Shoring/Polyethylene construction methods and design techniques. The Earth-Sheltered Solar Greenhouse Book has 230 pages with nearly 200 illustrations, photos, diagrams, lists, charts and drawings. It contains all the information you need to free you from the pesticide, herbicide, fungicide, waxed, and E-coli laden, genetically modified and irradiated supermarket produce.

Biodiversity and Native America Paul E. Minnis, Wayne J. Elisens, 2001-08-01 Exploring the relationship between Native Americans and the natural world, *Biodiversity and Native America* questions the widespread view that indigenous peoples had minimal ecological impact in North America. Introducing a variety of perspectives - ethnopharmacological, ethnographic, archaeological, and biological - this volume shows that Native Americans were active managers of natural ecological systems. The book covers groups from the sophisticated agriculturalists of the Mississippi River drainage region to the low-density hunter-gatherers of arid western North America. This book allows readers to develop accurate restoration, management, and conservation models through a thorough knowledge of native peoples' ecological history and dynamics. It also illustrates how indigenous peoples affected environmental patterns and processes, improving crop diversity and agricultural patterns.

Biodiversity Conservation C. A. Perrings, 2012-12-06 This volume is one of a number of publications to carry the results of the first research programme of the Royal Swedish Academy of Science's Beijer Institute. The Institute was formed in 1991 in order to promote interdisciplinary research between natural and social scientists on the interdependency between economic and ecological systems. In its first research programme, the Biodiversity Programme, the Institute brought together a number of leading economists and ecologists to address the theoretical and policy issues associated with the current high rates of biodiversity loss in such systems - whether the result of direct depletion, the destruction of habitat, or specialisation in agriculture, forestry and fisheries. This volume reports some of the more policy-oriented work carried out under the programme. The broad aim of the programme is to further our understanding of the causes and consequences of biodiversity loss, and to identify the options for addressing the problem. The results have turned out to be surprising to those who see biodiversity loss primarily in terms of the erosion of the genetic library. In various ways the work

carried out under the programme has already begun to alter our perception of where the problem in biodiversity loss lies and what policy options are available to deal with it. Indeed, the programme has provided a powerful set of arguments for reappraising not just the economic and ecological implications of biodiversity loss, but the whole case for development based on specialisation of resource use.

Keeping it Living Douglas Deur, Nancy J. Turner, 2005 *Keeping It Living* brings together some of the world's most prominent specialists on Northwest Coast cultures to examine traditional cultivation practices from Oregon to Southeast Alaska. It explores tobacco gardens among the Haida and Tlingit, managed camas plots among the Coast Salish of Puget Sound and the Strait of Georgia, estuarine root gardens along the central coast of British Columbia, wapato maintenance on the Columbia and Fraser Rivers, and tended berry plots up and down the entire coast. With contributions from a host of experts, Native American scholars and elders, *Keeping It Living* documents practices of manipulating plants and their environments in ways that enhanced culturally preferred plants and plant communities. It describes how indigenous peoples of this region used and cared for over 300 species of plants, from the lofty red cedar to diminutive plants of backwater bogs.

You Can't Fool Mother Nature Byron Kennard, 2020-03-05 Environmentalism is one of the most consequential and transformative social movements in all human history. Where did it come from? How did it evolve? What does it signify? What has it accomplished? How has it failed? Where does it now stand? What are its future prospects? And now, on a planet experiencing catastrophic climate change, what does the environmental movement have to offer? In this book, these questions are addressed by someone who helped organize the environmental movement a half-century ago and who has lived to tell the story.

Fire Ecology of Pacific Northwest Forests James K Agee, 1996-03-01 The structure of most virgin forests in the western United States reflects a past disturbance history that includes forest fire. James K. Agee, an expert in the emergent field of fire ecology, analyzes the ecological role of fire in the creation and maintenance of natural western forests, focusing primarily on forest stand development patterns. His discussion of the natural fire environment and the environmental effects of fire is applicable to a wide range of temperate forests.

Coevolution William H. Durham, 1991 Charles Darwin's *On the Origins of Species* had two principal goals: to show that species had not been separately created and to show that natural selection had been the main force behind their proliferation and descent from common ancestors. In *Coevolution*, the author proposes a powerful new theory of cultural evolution--that is, of the descent with modification of the shared conceptual systems we call cultures--that is parallel in many ways to Darwin's theory of organic evolution. The author suggests that a process of cultural selection, or preservation by preference, driven chiefly by choice or imposition depending on the circumstances, has been the main but not exclusive force of cultural change. He shows that this process gives rise to five major patterns or modes in which cultural change is at odds with genetic change. Each of the five modes is discussed in some detail and its existence confirmed through one or more case studies chosen for their heuristic value, the robustness of their data, and their broader implications. But *Coevolution* predicts not simply the existence of the five modes of gene-culture relations; it also predicts their relative importance in the ongoing dynamics of cultural change in particular cases. The case studies themselves are lucid and innovative reexaminations of an array of oft-pondered anthropological topics--plural marriage, sickle-cell anemia, basic color terms, adult lactose absorption, incest taboos, headhunting, and cannibalism. In a general case, the author's goal is to demonstrate that an evolutionary analysis of both genes and culture has much to contribute to our

understanding of human diversity, particularly behavioral diversity, and thus to the resolution of age-old questions about nature and nurture, genes and culture.
