Ali Alikhan, Thomas L.H Hocker

Mohs Micrographic Surgery Stephen N. Snow, George R. Mikhail, 2004 Mohs Micrographic Surgery, an advanced treatment procedure for skin cancer, offers the highest potential for recovery--even if the skin cancer has been previously treated. This procedure is a state-of-the-art treatment in which the physician serves as surgeon, pathologist, and reconstructive surgeon. It relies on the accuracy of a microscope to trace and ensure removal of skin cancer down to its roots. This procedure allows dermatologists trained in Mohs Surgery to see beyond the visible disease and to precisely identify and remove the entire tumor, leaving healthy tissue unharmed. This procedure is most often used in treating two of the most common forms of skin cancer: basal cell carcinoma and squamous cell carcinoma. The cure rate for Mohs Micrographic Surgery is the highest of all treatments for skin cancer--up to 99 percent even if other forms of treatment have failed. This procedure, the most exact and precise method of tumor removal, minimizes the chance of regrowth and lessens the potential for scarring or disfigurement

Mohs Micrographic Surgery: From Layers to Reconstruction Christopher B. Harmon, Stanislav N. Tolkachjov, 2023-03-02 A systematic approach to Mohs surgery and reconstruction from renowned skin cancer surgeons More than 5.4 million cases of nonmelanoma skin cancer, most notably basal cell, squamous cell carcinoma, and melanoma, occur annually in the United States alone. The Mohs technique, developed in the 1950s and refined over the years, has the highest cure rate of any treatment for nonmelanoma skin cancer, is used increasingly for melanoma, and the lowest recurrence rate. Mohs Micrographic Surgery: From Layers to Reconstruction by renowned dermatologic and Mohs surgeons Christopher Harmon and Stanislav Tolkachjov provides a detailed yet succinct road map to learning and mastering Mohs and reconstruction. The algorithmic organization coupled with instructive photographs and illustrations provide a reader-friendly format conducive to learning. The two opening chapters describe the principles of Mohs surgery including: progressive layer excision to determine if wound margins are cancer free, associated pitfalls, recurrences, special sites, reconstructive principles, and general considerations. The subsequent eight chapters are organized by facial site, from the nose to the eyelid/eyebrow. The final two chapters discuss combination reconstructions stretching over multiple subunits and perioperative management and wound care. Key Highlights An impressive group of global Mohs and reconstruction experts provide firsthand pearls that guide optimal treatment Relevant anatomical aspects that impact excision and reconstruction are detailed, including structures, skin tension lines, tissue planes, and dangers zones More than 20 procedural videos provide hands-on guidance on how to perform specific steps in Mohs and reconstruction This unique resource will help residents, fellows, and surgeons in dermatology, plastic surgery, and facial plastic surgery master nuances of Mohs reconstructive techniques to achieve the most functional and aesthetically pleasing outcomes for patients.

Cutaneous Malignancies Brian Gastman, 2016-12-30 The treatment of skin cancer has become an increasingly multispecialty practice. Ongoing surgical and postsurgical advances and emergent factors that predispose patients to these tumors have changed the treatment paradigm. Having a keen understanding of diagnostic, surgical, and nonsurgical treatment options is key to identifying, treating, or referring patients with potential cutaneous malignancies. While Brian R. Gastman's Cutaneous Malignancies: A Surgical Perspective is the first of its kind to emphasize surgical management of skin cancer, several sections are devoted to systemic nonsurgical therapies affecting patient care and surgical intervention. Topics encompassed include prevention, diagnosis, medication management, appropriate margin size, reconstruction methods, and the importance of stellar dermatopathology. Key Highlights The role of Mohs micrographic surgery and radiation in skin cancer treatment Treatment approaches for the two most common forms of skin cancer respectively, basal cell carcinoma and squamous cell carcinoma Surgical treatment of cutaneous malignant melanoma and other high-risk malignancies Clinical insights on completion lymphadenectomy and sentinel node biopsy for melanoma, two topics rarely addressed in context with skin cancer Diagnosis and treatment of rare malignancies including Merkel cell carcinoma, dermatofibrosarcoma protuberans, cutaneous angiosarcoma, and cutaneous leiomyosarcoma More than 400 high-quality illustrations further delineate surgical modalities Edited by an esteemed dual board certified plastic surgeon and otolaryngologist, this definitive book is the most complete guide to surgical management of skin cancer. It is essential reading for plastic surgeons, dermatologists, otolaryngologists, and all clinicians who treat or refer patients with suspected skin cancer.

Mohs Micrographic Surgery Keyvan Nouri, 2012-02-15 This book is written for dermatologists, otolaryngologists, facial plastic surgeons and any physician who want to provide state of the art treatment for skin cancer patients. Considering the high incidence of non-melanoma skin cancers such as Basal Cell Carcinoma and Squamous Cell Carcinoma (accounting for over one million cases per year in the United States) and since Mohs Micrographic Surgery has become the treatment of choice for these skin cancers, the popularity of this technique has been increasing dramatically, worldwide.

High-Risk Cutaneous Squamous Cell Carcinoma Chrysalyne D. Schmults, 2016-04-29 This book is a cutting-edge resource that provides clinicians with the up-to-date practical knowledge required in order to manage SCC patients optimally. It summarizes newly available information relating to the definition of high-risk SCC, its pathophysiologic underpinnings, and its management. New prognostic information and staging systems are summarized that enable high-risk tumors to be defined more precisely than ever before. Many helpful tips are provided on the practical management of challenging cases, including multiple tumors/field cancerization, high-risk tumors, nodal metastases, and unresectable disease. The authors are all acknowledged experts in the emerging field of high-risk and advanced SCC.

Non-melanoma Skin Cancer of the Head and Neck Faruque Riffat, Carsten E. Palme, Michael Veness, 2015-09-30 Non-melanoma skin cancer is a global public health issue. With an ever-increasing, and ageing, world population coupled with increasing numbers of immunosuppressed individuals the number of patients continues to rise. The head and neck is overwhelmingly the most frequent location for the development of a non-melanoma skin cancer and as such challenges the clinician with its complex anatomy. The importance of maintaining the aesthetics of the face and the function of the anatomy cannot be overstated, yet ultimately it is always the aim of curing a patient with the minimum of morbidity that clinicians strive for. However, the spectrum of presentations and subsequent management varies widely, ranging from patients with the ubiquitous low-risk mid-face basal cell carcinoma to those diagnosed with relatively uncommon but potentially life-threatening high-risk squamous cell carcinomas (e.g. involving metastatic lymph nodes or with perineural invasion present) and Merkel cell carcinomas.
