Evolving Neural Crest Cells Brian Frank Eames, Daniel Meulemans Medeiros, Igor Adameyko, 2020-07-28 Vertebrates possess lineage-specific characteristics. These include paired anterior sense organs and a robust, modular head skeleton built of cellular cartilage and bone. All of these structures are derived, at least partly, from an embryonic tissue unique vertebrates - the neural crest. The evolutionary history of the neural crest, and neural crest cells, has been difficult to reconstruct. This volume will use a comparative approach to survey the development of the neural crest in vertebrates, and neural crest-like cells, across the metazoa. This information will be used to reveal neural crest evolution and identify the genomic, genetic, and gene-regulatory changes that drove them. Key selling features: Summarizes the data regarding neural crest cells and neural crest derivatives Uses a broad-based comparative approach Suggests hypothesis that the origin of neural crest cells involved the novel co-activation of ancient metazoan gene programs in neural border cells Illustrates how the emergences of neural crest made possible the diversification of vertebrate heads

The Central Nervous System Per Brodal, 2004 Providing clear, well-illustrated descriptions of brain structures in light of their functions, this cohesive and well-established textbook fosters understanding of the intimate relationship between the structure and function of the nervous system. Its focus on the integration of basic sciences with their clinical applications makes the book particularly well-suited for medical students needing knowledge of neuroscience as a basis for clinical thinking. For the third edition, two new chapters have been added on the vestibular system and control of eye movements, and all other chapters have been thoroughly revised.

The Nervous System Adina T. Michael-Titus, Patricia Revest, Peter Shortland, 2014-04-11 This is an integrated textbook on the nervous system, covering the anatomy, physiology and biochemistry of the system, all presented in a clinically relevant context appropriate for the first two years of the medical student course. One of the seven volumes in the Systems of the Body series. Concise text covers the core anatomy, physiology and biochemistry in an integrated manner as required by system- and problem-based medical courses. The basic science is presented in the clinical context in a way appropriate for the early part of the medical course. There is a linked website providing self-assessment material ideal for examination preparation.

Nerve Cells and Nervous Systems A.G. Brown, 2001-06-14 It is now about 10 years since the first edition of Nerve Cells and Nervous Systems was published. There have been many important advances across the whole field of neuro science since 1990 and it was obvious that the first edition had become much less useful than when it was published. Hence this new edition. I have attempted to keep to the aims of the first edition by presenting the general principles of neuroscience in the context of experimental evidence. As with the first edition, the selection of material to include, or exclude, has been difficult and invariably reflects my personal biases. I hope that not too many readers will be disappointed with the selections. I have unashamedly retained material, and, in particular, illustrations where I think they remain of importance to an understanding of the field and to its historical development. As before, I have attempted as reasonable a coverage as possible within the confines of a book that should be easy to carry around, to handle and, I hope, to read. The book should be useful for anyone studying the nervous system at both undergraduate and immediate postgraduate levels. In particular, under graduates reading neuroscience or any course containing a neuroscience component, such as physiology, pharmacology, biomedical sciences or psychology, as well as medicine and veterinary medicine should find the book helpful.

The Nervous System: Introduction and Review Charles Robert Noback, Robert J. Demarest, 1972 Written for general readers, this fascinating volume examines the way the nervous system governs our daily activity. What is memory, and how is it possible to lose it? How do we see? When we

smell, what is happening in our nose? From a description of the physiological processes involved in these everyday phenomena, the author goes on to consider how sensation acquires meaning--as in the occurrence of pain for example--and how the nervous system is affected by external influences

Bipolar Disorders Jair C. Soares, Allan H. Young, 2016-05-25 Over the past two decades, driven by the enormous public health importance of bipolar disorder, research initiatives have begun to elucidate the pathophysiology of this prevalent and debilitating condition. These research initiatives have led to breakthroughs in our understanding of causation, and now promise to foster the development of novel treatments. This new edition presents contributions from the leaders at the forefront of these areas of research, and includes chapters on the groundbreaking advances in the fields of genetics, neuroimaging, neuropsychopharmacology, oxidative stress and neuronal resilience, inflammatory mechanisms, psychosocial factors, childhood onset and late-life bipolar disorder, and many other important areas. Throughout, the therapeutic implications and potential of this new understanding are emphasized. This will be essential reading for those interested in the neurobiology of mental illness, and will be of interest to mental health practitioners more generally.

Pathologic Findings in Stranded Marine Mammals: A Global Perspective Gregory Dana Bossart, Alvin Cyril Camus, Debra Lee Miller, Stephen Raverty, 2022-02-09 This project is posthumously dedicated to Dr. Gregory Dana Bossart. Whether you knew him as colleague, mentor, friend, family member or simply 'knew of him', you could not help but be awestruck by his dedication, intelligence, thoughtfulness, work ethic and passion for scientific inquiry, especially for conservation of the marine environment. Many of his publications were seminal in marine mammal health, including infectious, environmental and zoonotic diseases. As we collected manuscripts for this special Frontiers edition, it was heartwarming to hear the comments from contributors. So many research scientists, field biologists and veterinarians could easily have given up and said, 'I just can't do this now', especially with the added challenges posed by the current COVID-19 pandemic. Instead, contributors from around the world were determined to contribute to this collection because of their inspiration and shared commitment with Greg's vision. The love and admiration within the marine community for Greg is phenomenal. With that said, we would be remiss if we did not say a few words about Greg as a mentor and friend. Greg had a knack for helping students realize their abilities and pursue their own independent contributions to the marine mammal community. He shared in their successes and worked tirelessly to facilitate their aspirations. Greg would involve students, early-career scientists and colleagues in projects, introduce them to collaborators and promote them and their work. Greg was a genuinely caring person. When he asked you 'how are you doing', he honestly wanted to know. He was always there, ready to listen and provide guidance. If you were to ask Greg what was most important to him in life, he would say God, family and marine life (and one could argue that he had a special fondness for manatees). He believed in the beauty of nature and that God had a hand in all of it. He was in pursuit of ensuring that we all share this earth responsibly and sustainably. We miss Greg dearly, but honor and celebrate him as we carry on in our pursuits.

Sensitization in the Nervous System Charles D. Barnes,1988-10-15 Sensitization is a concept of learning and memory that has grown out of experiments on simple animals. Interest in sensitization has grown tremendously in the last several years, fueled mainly by evidence of the molecular basis of sensitization in invertebrates on the one hand and the study of cocaine abuse, which produces behavioral sensitization, on the other. Because the rapid advance of information across such a broad range of research areas has made an integrated approach necessary, this volume combines findings on sensitization across the phylogenetic scale.

Primer on the Autonomic Nervous System Italo Biaggioni,Kirsteen Browning,Gregory Fink,Jens Jordan,Phillip A. Low,Julian F.R. Paton,2022-12-07 Primer on the Autonomic Nervous System, Fourth Edition provides a concise and accessible overview of autonomic neuroscience for students, scientists, and clinicians. The book's 142 chapters draw on the expertise of more than 215 basic scientists and clinicians who discuss key information on how the autonomic nervous system controls the body, particularly in response to stress. This new edition also focuses on the translational crossover between basic and clinical research. In addition to comprehensively covering all aspects of autonomic physiology and pathology, topics such as psychopharmacology decoding and modulating nerve function are also explored. Provides concise and practical information on the autonomic nervous system Discusses all aspects of autonomic physiology and pathology Contains new content on psychopharmacology and modulating nerve function

Central Nervous System Pathology G.N. Kryzhanovsky,2012-12-06 One hardly always receives due credit for working out a general theory. It is more enticing to be successful in discovering new phenomena of tangible facts even if they are particular ones. The great technical opportunities which now exist and the new methods of investigation which recently seemed to be fantastic have made that even more enticing. Therefore, the establishment of general regularities seems to be an abstract occupation whose significance is not always clear. Nevertheless, a general theory should be elaborated. Factual material should be systematized and generalized as it accumulates. As an increasing amount of data is obtained, it becomes increasingly urgent to ascertain the general regularities which determine the typical mechanisms of individual phenomena. Researchers approach these aspects of scientific activity in different ways. Some of them are interested in analyzing the specifics of a phenomenon, while others try to find a general regularity in an individual fact and look for its confirmation in new material. Both of these indispensable forms of research have been reflected in this book.
