NGA GPS Monitor Station High-Performance Cesium Frequency Standard Stability: From NGA Kalman Filter Clock Estimates ,2005 The National Geospatial-Intelligence Agency (NGA) operates a worldwide network of GPS monitoring stations that utilizes high-performance cesium frequency standards (CFS) and geodetic quality GPS receivers. The NGA Monitor Station Network (MSN) has been in operation for almost 20 years and has recently moved to a 24/7 operation. The NGA monitor station CFS are located in non-laboratory environments and in some instances, are logistically challenging. With the onset of the Department of Defense GPS Accuracy Improvement Initiative (Aii), the NGA monitor station cesiums, along with the associative electronics, must be monitored more frequently for quality control. Aii involves the Air Force Operational Control Segment (OCS), at Schriever AFB, to incorporate a subset of the NGA monitor stations in real-time processing to improve the quality of the broadcast ephemeris and clock parameters. The addition of these stations will also expand the network coverage to allow all GPS satellites to be monitored without any gaps. This paper is a summary of the stability of the NGA MSN cesiums using one year 52 weeks of Kalman Filter clock estimate data computed daily at the NGA facility in St. Louis. The quality of the CFSs to be shown and summarized in this report is from eleven NGA monitor stations, which are to be added to the OCS estimation process under Aii. Results show that the NGA configuration of CFS has maintained the industry standards for high performance cesiums. This gives the NGA GPS program some of the most reliable monitor station clock data to support current and future GPS navigation systems.

Hyperspectral Imaging for Fine to Medium Scale Applications in Environmental Sciences Michael Vohland,András Jung,2021-05-14 The aim of the Special Issue “Hyperspectral Imaging for Fine to Medium Scale Applications in Environmental Sciences” was to present a selection of innovative studies using hyperspectral imaging (HSI) in different thematic fields. This intention reflects the technical developments in the last three decades, which have brought the capacity of HSI to provide spectrally, spatially and temporally detailed data, favoured by e.g., hyperspectral snapshot technologies, miniaturized hyperspectral sensors and hyperspectral microscopy imaging. The present book comprises a suite of papers in various fields of environmental sciences—geology/mineral exploration, digital soil mapping, mapping and characterization of vegetation, and sensing of water bodies (including under-ice and underwater applications). In addition, there are two rather methodically/technically-oriented contributions dealing with the optimized processing of UAV data and on the design and test of a multi-channel optical receiver for ground-based applications. All in all, this compilation documents that HSI is a multi-faceted research topic and will remain so in the future.

**AF/NGA GPS Monitor Station High-Performance Cesium Frequency Standard Stability 2005/2006: From NGA Kalman Filter Clock Estimates** ,2007 Both the National Geospatial-Intelligence Agency (NGA) and the United States Air Force (USAF/AF) operate a worldwide network of GPS monitoring stations that utilizes high-performance cesium frequency standards (CFSs) and geodetic quality GPS receivers. The USAF stations are somewhat equatorial, whereas the NGA stations are primarily in both the Northern and Southern Hemispheres. The NGA Monitor Station Network (MSN) has been in operation since 1983 and the operation in St. Louis currently monitors all the NGA stations on a 24/7 basis. The USAF operates their stations in a similar manner. The NGA monitor station CFSs are located in non-laboratory environments and in some instances, are logistically challenging. With the onset of the Department of Defense GPS Accuracy Improvement Initiative (AII), the NGA monitor station cesiums, along with the associative electronics, must be monitored more frequently for quality control. AII involves the USAF Operational Control Segment (OCS), at Schriever AFB, to incorporate at first a subset (six) of the NGA monitor stations in real-time processing to improve the quality of the broadcast ephemeris and clock parameters. Two more NGA monitor stations were added in the early fall 2006. The remaining three are scheduled to be added during the fall/winter 2006 time frame. The addition of the NGA stations will expand the network coverage to allow all GPS satellites to be monitored without any gaps.

GPS Signal Phase Tracking Using a Kalman Filter Thomas H. Newman,Naval Postgraduate School (U.S.),1997-06-01 One of the more significant error sources in using the Global Positioning System for attitude determination of aircraft and earth orbiting satellites is multipath interference. The GPS signal is reflected from the spacecraft structures resulting in a composite signal that differs from the direct line-of-sight signal in terms of phase and amplitude. The resulting phase errors can have a significant impact on the attitude determination error. This thesis will describe the GPS signal generation and provide tools to simulate the signal. A Kalman filter will then be developed to track the phase changes in the simulated GPS signals, and its performance described in the absence and presence of multipath.

**GPS Carrier-Phase Frequency Transfer on the NIMA Monitor Station Network** ,2002 The National Imagery and Mapping Agency (NIMA) maintains a worldwide GPS Monitor Station Network (MSN). We are in the process of studying carrier-phase frequency transfer as one method for understanding the overall network performance, and for potential use in testing future GPS receivers. We have developed processing software that uses 30-second dual frequency data in a continuous sequential estimator, which allows unlimited forward processing as well as optional backwards (fixed-interval) smoothing. States in the estimation include tropospheric and ionospheric delays, corrections (assumed small) to the station positions, and double-differenced carrier-phase biases. Satellite positions are taken from either precise or broadcast ephemerides. We have tested our process using both zero-baseline datasets and benchtop tests. Our initial results indicate that instabilities seen in the estimated time offsets are dominated by temperature variations coupling to the GPS receiver used.
