*Operating System* M. Naghibzadeh, 2005 Operating System is the most essential  
 program of all, without which it becomes cumbersome to work with a computer.  
 It is the interface between the hardware and computer users making the computer  
 a pleasant device to use. The Operating System: Concepts and Techniques clearly  
 defines and explains the concepts: process (responsibility, creation, living,  
 and termination), thread (responsibility, creation, living, and termination),  
 multiprogramming, multiprocessing, scheduling, memory management (non-virtual  
 and virtual), inter-process communication/synchronization (busy-wait-based,  
 semaphore-based, and message-based), deadlock, and starvation. Real-life  
 techniques presented are based on UNIX, Linux, and contemporary Windows.  
 The book has briefly discussed agent-based operating systems, macro-kernel,  
 microkernel, extensible kernels, distributed, and real-time operating systems.  
 The book is for everyone who is using a computer but is still not at ease with  
 the way the operating system manages programs and available resources in order  
 to perform requests correctly and speedily. High school and university students  
 will benefit the most, as they are the ones who turn to computers for all sorts  
 of activities, including email, Internet, chat, education, programming, research,  
 playing games etc. It is especially beneficial for university students of  
 Information Technology, Computer Science and Engineering. Compared to other  
 university textbooks on similar subjects, this book is downsized by eliminating  
 lengthy discussions on subjects that only have historical value.
