Find cell phones' area online by cell tower triangulation utilizing LAC (Location Area Code) and Celled from PC, iphone or Androide phone. Cell tower triangulation utilizes the LAC and Cellid to focus the position of a

cellular smartphone. With information from no less than three cell towers, this strategy can ascertain a handset's area exactly. Each one base station covers a certain region, the more cell towers in your general vicinity, the more precise result it delivers. So the thickness of cell towers decides the precision. For the most part, the thickness is higher in the urban zones particularly at downtown. While in country territories, where there are less cell towers, the result is less precise. Hazardous Seas Louise K. Comfort,Harkunti P. Rahayu,2023-07-20 Tsunamis are infrequent but terrifying hazards for coastal communities. Difficult to predict, they materialize with little warning, claiming thousands of lives and causing billions of dollars in damage. Recent mega-tsunamis in Japan and Indonesia claimed close to 250,000 lives, triggering wide-scale economic and social disruption. Developing countries cannot afford costly underwater cable systems, and governments and relief organizations have been forced to rely on flawed warning systems such as deep-sea buoys. Now, a groundbreaking new approach to tsunami detection and warning, which relies on low-cost underwater sensors and networks of smartphone communication, has changed the equation. Developed by an international,

interdisciplinary team of researchers, this approach allows at-risk coastal communities to have an economically viable, scientifically sound means to protect themselves. Coeditors Louise K. Comfort and Harkunti P. Rahayu, accomplished experts in disaster preparedness, contend that it will give communities precious additional minutes to communicate warnings about imminent tsunamis to residents, potentially saving many lives. Chapters authored by a close group of collaborators present the science behind this new approach, describing conceptual design, computational models, and real-time testing of a prototype system in the warm equatorial waters of Indonesia's Mentawai Sea. Introductory chapters explain the sociotechnical approach—how undersea sensors can transmit data to a network of electronic devices on land to alert residents to impending tsunami threats in near-real time. Subsequent chapters explore what this might look like: assessing communities at risk; designing interactive information systems for communication during an emergency; designing wireless networks for smartphone communication that can guide residents to safety; and designing community-based shelters. The book concludes with a thoughtful analysis of how these sociotechnical advances might be used for all coastal cities at risk of tsunamis, sea-level rise, storm surges, and other hazards. Hazardous Seas is an invaluable guide for policy makers and international NGOs looking to save lives from tsunamis and mitigate crippling damage to communities, and provides a comprehensive overview of tsunami detection and warning for students of engineering, computer

science, planning, policy, and economic and environmental analysis.

The Evolution of Travel Time Information Systems Margarita Martínez-Díaz,2022-01-21 This book deals with the estimation of travel time in a very comprehensive and exhaustive way. Travel time information is and will continue to be one key indicator of the quality of service of a road network and a highly valued knowledge for drivers. Moreover, travel times are key inputs for comprehensive traffic management systems. All the above-mentioned aspects are covered in this book. The first chapters expound on the different types of travel time information that traffic management centers work with, their estimation, their utility and their dissemination. They also remark those aspects in which this information should be improved, especially considering future cooperative driving environments.Next, the book introduces and validates two new methodologies

designed to improve current travel time information systems, which additionally have a high degree of applicability: since they use data from widely disseminated sources, they could be immediately implemented by many administrations without the need for large investments.
