Should the USAF Be Involved in Planetary Defense U. S. Air U.S. Air Force Air Command and Staff College,U.s. Air Force Air Command,2014-06-05 Should the United States Air Force take in the nation's stance on planetary defense? Planetary defense in this paper means protecting the planet and therefore our nation from the impact of large Near Earth Objects (NEOs). This topic is usually relegated to the realm of science fiction movies and books but the consequences of such an impact are too great to ignore and simply dismissing it as impossible. Before addressing the role of the United States Air Force in such project, the problem of a NEO impact is analyzed. First, the paper analyzes the problem itself and discusses the probability that a NEO large enough to cause damage will impact the earth. There is discussion of past NEO impacts during the earth's history and the craters that leave us tell tale signs of these impacts that we can gather data from. Secondly, the effects and consequences of a NEO impact are discussed. This shows the reader how even though the probability may be low, the consequences are so high that we must take a possible NEO impact as a serious matter. The paper then discusses how to predict and prevent an impact. In this chapter there is discussion on what the U.S. and other governments are currently doing to prepare for such an impact. We look at how many objects are cataloged that could possibly strike the earth in the near future and what we're currently doing to give the earth advance warning. Also discussed are possible options to prevent an impact once a NEO is discovered to be on a collision course with the earth. Finally the problem solution method is used to analyze what U.S. government agencies should have a role in planetary defense, including those that are already contributing or those that do not have a role. The conclusion reached is that the United States Air Force should play an increasing role in planetary defense. The Air Force possesses unique tracking, weapon and space launch capabilities that could greatly aid in the development of a formalized planetary defense system fielded by the U.S. government.

The MESSENGER Mission to Mercury D.L. Domingue,C.T. Russell,2007-12-19 This is the first book to present the science and instruments of NASA'S MESSENGER space mission. The articles, written by the experts in each area of the MESSENGER mission, describe the mission, spacecraft, scientific objectives, and payload. The book is of interest to all potential users of the data returned by the mission, to those studying the nature of Mercury, and by all those interested in the design and implementation of planetary exploration missions.

A Compendium of Papers in the Fields of Geodesy and Planetary Geometry Prepared at AFCRL During 1962 Owen W. Williams,1963 A series of technical papers were prepared by scientists of Air Force Cambridge Laboratories during 1962 in the fields of geodesy and planetary geometry. These papers describe research activities in the areas of satellite geodesy (in particular Project ANNA), rocketflare triangulation, airborne gravimetry, absolute and relative gravity, laser geodesy, and selenodesy. Illustrations show recent geodetic instrumentation developments and technique configuration. (Author).

Planetary Encounters Robert M. Powers,1980-01-01

Spacecraft that Explored the Inner Planets Venus and Mercury Thomas Lund,2023-07-03 A series of increasingly capable spacecraft were sent to explore the inner planets Venus and Mercury. The history of that planetary exploration is traced in this book along with the evolution of sophisticated spacecraft that unveiled long-sought secrets of the planets. The spacecraft were ingenious and reflected the best efforts of talented people working with the available technology of the day. Additionally, this book showcases engineering involved in those capable machines. A consecutive series of 34 planetary spacecraft, which span the time period 1961 to 2021, are described. This includes the unsuccessful missions of several early spacecraft that paved the way for a better understanding of Venus' hostile environments. This book will describe many successful spacecraft sent to Venus by the Soviet Union and many successful spacecraft sent to Venus and to Mercury by the United States. The recent exploration of Venus by the European Space Agency's Venus Express and the Japanese spacecraft Akatsuki can also be found in this book. The author draws on over 50 years of experience on aircraft and spacecraft systems to tell the story of these planetary spacecraft. The spacecraft experience includes being the technical lead for the landing radars on the Surveyor and Apollo lunar landers as well as providing analyses for the rendezvous radar for the Space Shuttle. Practical engineering experience is augmented by Master's degrees in electrical engineering, physics, and business administration.

Moving Planets Around Javier Roa,Adrian S. Hamers,MAXWELL X. CAI,Nathan W. C. Leigh,2020-09-01 An introduction to the laws of celestial mechanics and a step-by-step guide to developing software for direct use in astrophysics research. This book offers both an introduction to the laws of celestial mechanics and a step-by-step guide to developing software for direct use in astrophysics research. It bridges the gap between conventional textbooks, which present a rigorous and exhaustive exposition of theoretical concepts, and applying the theory to tackle real experiments. The text is written engagingly in dialogue form, presenting the research journey of the fictional Alice, Bob, and Professor Starmover. Moving Planets Around not only educates students on the laws of Newtonian gravity, it also provides all that they need to start writing their own software, from scratch, for simulating the dynamical evolution of planets and exoplanets, stars, or other heavenly bodies. The first half of the book develops a fully functional N-body integrator, using state-of-the art integration techniques, explaining both the techniques and the reasons that they are useful. The second half of the book focuses on using an advanced integration scheme to conduct real research, leading students in an investigation of the long-term dynamical stability of extrasolar circumbinary planets. At the end of the journey, students will be ready to design, conduct, and publish peer-review quality research.

Beyond Earth Charles P. Wohlforth,Amanda R. Hendrix,2016 Presents a chronicle of the developments and initiatives that have transformed the idea of space colonization into an achievable goal, sharing arguments in favor of targeting Saturn's moon, Titan.

Planetary Astronomy from Satellite-substitute Vehicles John Strong,Gérard De Vaucouleurs,Fritz Zwicky,1960

Russian Planetary Exploration Brian Harvey,2007-01-24 Illustrated with photographs from Soviet Venus and Mars probes, images of spacecraft, diagrams of flight paths and maps of landing sites, this book draws on published scientific papers, archives, memoirs and other material. The text reviews Soviet engineering techniques and science packages, as well the difficulties which ruined several missions. The program's scientific and engineering legacy is also addressed, within the Soviet space effort as a whole.

Planetary Cartography and GIS Henrik Hargitai,2019-02-22 This book approaches geological, geomorphological and topographical mapping from the point in the workflow at which science-ready datasets are available. Though there have been many individual projects on dynamic maps and online GISs, in which coding and data processing are given precedence over cartographic principles, cartography is more than "just" processing and displaying spatial data. However, there are currently no textbooks on this rapidly changing field, and methods tend to be shared informally. Addressing this gap in the literature, the respective chapters outline many topics pertaining to cartography and mapping such as the role and definition of planetary cartography and (vs?) Geographic Information Science; theoretical background and practical methodologies in geological mapping; science-ready versus public-ready products; a goal/procedure-focused practical manual of the most commonly used software in planetary mapping, which includes generic (ArcGIS and its extensions, JMARS) and specific tools (HiView, Cratertools etc.); extracting topographic information from images; thematic mapping: climate; geophysics; surface modeling; change detection; landing site selection; shared maps; dynamic maps on the

web; planetary GIS interfaces; crowdsourcing; crater counting techniques; irregular bodies; geological unit symbology; mapping center activities; and web services. All chapters were prepared by authors who have actually produced geological maps or GISs for NASA / the USGS, DLR, ESA or MIIGAİK. Taken together, they offer an excellent resource for all planetary scientists whose research depends on mapping, and for students of astrogeology.
