Gurcharan Singh

Plant Taxonomy Tod F. Stuessy, 2009 The field of plant taxonomy has transformed rapidly over the past fifteen years, especially with regard to improvements in cladistic analysis and the use of new molecular data. The second edition of this popular resource reflects these far-reaching and dramatic developments with more than 3,000 new references and many new figures. Synthesizing current research and trends, Plant Taxonomy now provides the most up-to-date overview in relation to monographic, biodiversity, and evolutionary studies, and continues to be an essential resource for students and scholars. This text is divided into two parts: Part 1 explains the principles of taxonomy, including the importance of systematics, characters, concepts of categories, and different approaches to biological classification. Part 2 outlines the different types of data used in plant taxonomic studies with suggestions on their efficacy and modes of presentation and evaluation. This section also lists the equipment and financial resources required for gathering each type of data. References throughout the book illuminate the historical development of taxonomic terminology and philosophy while citations offer further study. Plant Taxonomy is also a personal story of what it means to be a practicing taxonomist and to view these activities within a meaningful conceptual framework. Tod F. Stuessy recalls the progression of his own work and shares his belief that the most creative taxonomy is done by those who have a strong conceptual grasp of their own research.

Plant Names in Botanical Databases F. A. Bisby, 1994-01-01 This standard clarifies how to

determine what information is needed in order to specify scientific plant names and how to organize those names for botanical databasing purposes. Because databasing needs vary, this standard is flexible. It is divided into four variants or levels, and so it provides a scale of options for rendering plant names according to the degree of specificity needed. It identifies the elements that need to be considered: taxa, names elements (species, species aggregate, intergeneric hybrids and graft chimaeras, interspecific hybrids and graft chimaeras, intraspecific categories, subspecies, variety, cultivar), author strings, classes of names, and reference citations; and provides recommendations. This standard is useful for taxonomic reference databasing but may also meet the databasing needs of natural-history societies, nature reserves and conservation centers. Includes references and appendices.

Plant Taxonomy: Classical and Modern Methods Freddie Casey, 2020-09-15 The science that finds, identifies, classifies, describes and names plants is called plant taxonomy. It is closely associated with plant systematics. Plant taxonomy facilitates an organized system for the cataloging and naming of specimens. Identification, classification and description are the main goals of plant taxonomy. Plant identification is a process of identifying an unknown plant by comparing it with previously collected specimens or through an identification manual. Plant classification is the practice of placing known plants into categories or groups to show some relationship. Giving a formal description of a newly discovered species usually in the form of a scientific paper using ICN guidelines is called plant description. This book provides significant information about this discipline to help develop a good understanding of plant taxonomy and related fields. Coherent flow of topics, student-friendly language and extensive use of examples make it an invaluable source of knowledge. This book will prove to be immensely beneficial to students and researchers in this field of study.

Plant Taxonomy Lyman David Benson,2012-05-01

Plant Systematics Gurcharan Singh,2004 The book strikes a balance between classical fundamental information and the recent developments in plant systematics. Special attention has been devoted to the information on botanical nomenclature, identification and phylogeny of angiosperms with numerous relevant examples and detailed explanation of the important nomenclatural problems. An attempt has been made to present a continuity between orthodox and contemporary identification methods by working on a common example. The methods of identification using computers have been further explored to help better online identification. The chapter on cladistic methods has been totally revised, and molecular systematics discussed in considerable detail.--Jacket.
