World Health Organization

WHO global air quality guidelines Weltgesundheitsorganisation, World Health Organization, 2021-09-07 The main objective of these updated global guidelines is to offer health-based air quality guideline levels, expressed as long-term or short-term concentrations for six key air pollutants: PM_{2.5}, PM₁₀, ozone, nitrogen dioxide, sulfur dioxide and carbon monoxide. In addition, the guidelines provide interim targets to guide reduction efforts of these pollutants, as well as good practice statements for the management of certain types of PM (i.e., black carbon/elemental carbon, ultrafine particles, particles originating from sand and duststorms). These guidelines are not legally binding standards; however, they provide WHO Member States with an evidence-informed tool, which they can use to inform legislation and policy. Ultimately, the goal of these guidelines is to help reduce levels of air pollutants in order to decrease the enormous health burden resulting from the exposure to air pollution worldwide.

The Global Health Cost of PM_{2.5} Air Pollution World Bank, 2022-01-20 According to the Global Burden of Disease 2019 study, air pollution from fine particulate matter caused 6.4 million premature deaths and 93 billion days lived with illness in 2019. Over the past decade, the toll of ambient air pollution has continued to rise. Air pollution's significant health, social, and economic effects compel the World Bank to support client countries in addressing air pollution as a core development challenge. This publication estimates that the global cost of health damages associated with exposure to air pollution is \$8.1 trillion, equivalent to 6.1 percent of global GDP. People in low- and middle-income countries are most affected by mortality and morbidity from air pollution. The death rate associated with air pollution is significantly higher in low-and lower-middle income countries than in high-income countries. This publication further develops the evidence base for air-quality management through up-to-date estimates of air pollution's global economic costs. The analyses presented here build on previous cost estimates by the Bank and its partners, as well as on more comprehensive air-quality data from monitoring stations in many cities across the world. By providing monetary estimates of air pollution's health damages, this publication aims to support policy makers and decision-makers in client countries in prioritizing air pollution amid competing development challenges. Its findings build a robust economic case to invest scarce budgetary resources in the design and implementation of policies and interventions for improving air quality. Such investments will deliver benefits for societies at large, and particularly for vulnerable groups. This publication builds a strong case for scaling up investments for air pollution control in low-and middle-income countries.

WHO Guidelines for Indoor Air Quality World Health Organization, 2014 Built on existing WHO indoor air quality guidelines for specific pollutants, these guidelines bring together the most recent evidence on fuel use, emission and exposure levels, health risks, intervention impacts and policy considerations, to provide practical recommendations to reduce this health burden.

Health Risks of Indoor Exposure to Particulate Matter National Academies of Sciences, Engineering, and Medicine, Health and Medicine Division, Board on Population Health and Public Health Practice, 2016-10-26 The U.S. Environmental Protection Agency (EPA) defines PM as a mixture of extremely small particles and liquid droplets comprising a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, soil or dust particles, and allergens (such as fragments of pollen and mold spores). The health effects of outdoor exposure to particulate matter (PM) are the subject of both research attention and regulatory action. Although much less studied to date, indoor exposure to PM is gaining attention as a potential source of adverse health effects. Indoor PM can originate from outdoor particles and also from various indoor sources, including heating, cooking, and smoking. Levels of indoor PM have the potential to exceed outdoor PM levels. Understanding the major features and subtleties of indoor exposures to particles of outdoor origin can improve our understanding of the exposure-response relationship on which ambient air pollutant standards are based. The EPA's Indoor Environments Division commissioned the National Academies of Sciences, Engineering, and Medicine to hold a workshop examining the issue of indoor exposure to PM more comprehensively and considering both the health risks and possible intervention strategies. Participants discussed the ailments that are most affected by particulate matter and the attributes of the exposures that are of greatest concern, exposure modifiers, vulnerable populations, exposure assessment, risk management, and gaps in the science. This report summarizes the presentations and discussions from the workshop.

Air Pollution Modeling and Its Application XIX Carlos Borrego, Ana Isabel Miranda, 2008-07-22 In 1969, the North Atlantic Treaty Organization (NATO) established the C- mittee on Challenges of Modern Society (CCMS). The subject of air pollution was from the start one of the priority problems under study within the framework of various pilot studies undertaken by this committee. The organization of a periodic conference dealing with air pollution modelling and its application has become one of the main activities within the pilot study relating to air pollution. The first five international conferences were organized by the United States as the pilot country, the second five by the Federal Republic of Germany, the third five by Belgium, the fourth four by The Netherlands, the next five by Denmark and the last five by Portugal. This volume contains the abstracts of papers and posters presented at the 29th NATO/CCMS International Technical Meeting on Air Pollution Modelling and Its Application, held in Aveiro, Portugal, during September 24-28, 2007. This ITM was organized by the University of Aveiro, Portugal (Pilot Country and Host Organization). The key topics distinguished at this ITM included: Local and urban scale modelling; Regional and intercontinental modelling; Data assimilation and air quality forecasting; Model assessment and verification; Aerosols in the atmosphere; Interactions between climate change and air quality; Air quality and human health.

Particulate Matter (PM₂₅) Robert Esworthy, Library of Congress. Congressional Research Service, 2006 Particulate matter (PM), including fine particulate matter (PM_{2.5}), is one of the six principal pollutants for which the U.S. Environmental Protection Agency (EPA) has set National Ambient Air Quality Standards (NAAQS) under the Clean Air Act (CAA). NAAQS are designed to protect human health within an adequate margin of safety. After several years of litigation and other delays, EPA is moving to implement the NAAQS for PM_{2.5} promulgated in 1997. This report, which will be updated as developments warrant, provides information on the designation process for PM_{2.5} attainment and nonattainment areas. It also discusses issues that have been raised as EPA, the states, and nonattainment areas develop implementation strategies. On April 14, 2005, EPA published a final rule amending designated geographical areas for PM_{2.5} standards, which were originally published in January 2005. The Agency's amendments were based on a review of supplemental 2004 air monitoring data submitted by several states. As a result, 39 areas, consisting of 208 counties in 20 states and the District of Columbia, were designated as nonattainment areas PM_{2.5} nonattainment areas are required to develop comprehensive implementation plans, referred to as State Implementation Plans (SIPs), demonstrating how attainment will be reached by a designated deadline. SIPs include pollution control measures that rely on models of the impact on air quality of projected

emission reductions to demonstrate attainment. EPA published a proposed PM_{2.5} implementation rule November 1, 2005, that provides guidance and procedures for establishing controls to achieve and maintain attainment. A number of issues will continue to be debated as the implementation of the PM_{2.5} NAAQS progresses. Some areas that have not been designated as nonattainment under implementation of other NAAQS have been designated nonattainment for the first time. Questions and concerns include the following: what criteria were used to determine nonattainment; whether special provisions can be made for meeting attainment deadlines, particularly for areas affected by upwind pollution; what grants or other funding might be available to help areas reach attainment; and how nonattainment designation might affect economic development and transportation investments in an area. Legislation and EPA rulemaking that affect aspects of regulating air quality could influence the implementation process. Court challenges that followed the release of the eight-hour ozone designations, and EPA's ongoing mandated periodic review of PM NAAQS, could also affect PM_{2.5} NAAQS implementation. An EPA staff paper released in September 2005 as part of the periodic review recommended that the Agency consider more stringent PM standards.

Air Quality Guidelines World Health Organization, 2006 This book presents revised guideline values for the four most common air pollutants - particulate matter, ozone, nitrogen dioxide and sulfur dioxide - based on a recent review of the accumulated scientific evidence. The rationale for selection of each guideline value is supported by a synthesis of information emerging from research on the health effects of each pollutant. As a result, these guidelines now also apply globally. They can be read in conjunction with Air quality guidelines for Europe, 2nd edition, which is still the authority on guideline values for all other air pollutants. As well as revised guideline values, this book makes a brief yet comprehensive review of the issues affecting the application of the guidelines in risk assessment and policy development. Further, it summarizes information on: . pollution sources and levels in various parts of the world, . population exposure and characteristics affecting sensitivity to pollution, . methods for quantifying the health burden of air pollution, and . the use of guidelines in developing air quality standards and other policy tools. Finally, the special case of indoor air pollution is explored. Prepared by a large team of renowned international experts who considered conditions in various parts of the globe, these guidelines are applicable throughout the world. They provide reliable guidance for policy-makers everywhere when considering the various options for air quality management.

Nephrology and Public Health Worldwide G.B. Silva Junior, A. Ferreira Fuentes, M. Nangaku, G. Remuzzi, C. Ronco, 2021-11-02 Nephrology is one of the fastest growing specialties in medicine. Nevertheless, kidney disease is one of the most serious unmet health needs in many countries. To provide healthcare access with the desirable equity worldwide, the nephrology community needs to discuss this public health issue and take part in decisions for elaboration of public health policies with more justice and equity. This book brings together key current public health problems that affect kidney function and illuminates them in contributions by an international group of nephrologists and general practitioners. The chapters review current knowledge and provide guidelines to manage these conditions and decrease the disease burden. At the end, developments in the digital era and their application to kidney disease treatment are synthesized, and a broader outlook on the future of nephrology is given. Ultimately, the publication aims to gather nephrology and public health expertise from researchers from all over the world, providing a broad vision of issues that must be discussed and overcome to guarantee a better treatment for patients with kidney diseases in the world today.

Indoor Air Pollution David Mulenga, 2020-09-26 There is a paucity of scientific literature on indoor air pollution (IAP) concentration levels and its adverse health effects in sub-Saharan Africa. Although prenatal exposure to indoor air pollutants has in many cases been significantly associated with a number of adverse maternal and child health outcomes, little attention on monitoring air pollutants in Sub-Saharan households. This book explores the magnitude of particulate matter (PM_{2.5} in µg/m³) and volatile organic compounds (VOC in ppb) in Masaiti rural and Ndola urban districts of Zambia. It presents major environmental determinants of indoor air pollutants in rural and urban households in Zambia. The author uses the indoor air monitoring data to evaluate the association between prenatal exposure to indoor air pollution on mother's respiratory health and the occurrence of low birth weight, preterm birth and small for gestational age. Findings indicate that exposures experienced by pregnant women, who spend a large proportion of their time indoors and are involved in routine domestic use of biomass fuels for cooking even during pregnancy, have been measured to be many times higher than World Health Organization (WHO) guidelines. Therefore, in order to improve maternal and child health indices in sub-Saharan Africa and further reduce the disease burden due to indoor air pollution in general, the author recommends the following: - Increase availability of data on concentrations of indoor air pollution to aid in planning and development of national standards in sub-Saharan Africa. - Reinforce regulatory policies on clean energy use at household level and emissions in general. - Scale up research in and use of emerging low-cost sensors for assessing indoor air pollution periodically. - Raise levels of awareness among populations, especially women and children on adverse health effects of biomass use in sub-Saharan Africa.

WHO Guidelines for Indoor Air Quality, 2010 This book presents WHO guidelines for the protection of public health from risks due to a number of chemicals commonly present in indoor air. The substances considered in this review, i.e. benzene, carbon monoxide,

formaldehyde, naphthalene, nitrogen dioxide, polycyclic aromatic hydrocarbons (especially benzo[a]pyrene), radon, trichloroethylene and tetrachloroethylene, have indoor sources, are known in respect of their hazardousness to health and are often found indoors in concentrations of health concern. The guidelines are targeted at public health professionals involved in preventing health risks of environmental exposures, as well as specialists and authorities involved in the design and use of buildings, indoor materials and products. They provide a scientific basis for legally enforceable standards.
