Egg Drop Mini Grey, 2012-06-27 Now for something completely different from Mini Grey! A mother hen tells her chicks about the egg that wanted to fly. "The egg was young. It didn't know much. We tried to tell it, but of course it didn't listen." The egg loves looking up at the birds (yes, it has eyes). It climbs 303 steps (yes, it has legs) to the top of a very tall tower—and jumps. It feels an enormous egg rush. "Whee!" it cries. "I am flying!" But it is not flying, it is falling. Hold your tears, dear reader—there is a sunny ending for this modern-day Humpty Dumpty. Impossible to categorize, *Egg Drop* is Mini Grey at her zaniest.

Guide to Eggshell Usage Vincent Bronson, 2020-12-25 Insects and other arthropods lay a large variety of styles and shapes of eggs. Some of them have gelatinous or skin-like coverings, others have hard eggshells. Softer shells are mostly protein. It may be fibrous or quite liquid. Some arthropod eggs do not actually have shells, rather, their outer covering is actually the outermost embryonic membrane, the choroid, which serves to protect inner layers. The choroid itself can be a complex structure, and it may have different layers within it. It may have an outermost layer called an exochorion. Eggs which must survive in dry conditions usually have hard eggshells, made mostly of dehydrated or mineralized proteins with pore systems to allow respiration. Arthropod eggs can have extensive ornamentation on their outer surfaces. Fish and amphibians generally lay eggs which are surrounded by the extraembryonic membranes but do not develop a shell, hard or soft, around these membranes. Some fish and amphibian eggs have thick, leathery coats, especially if they must withstand physical force or desiccation. These types of eggs can also be very small and fragile. While many reptiles lay eggs with flexible, calcified eggshells, there are some that lay hard eggs. Eggs laid by snakes generally have leathery shells which often adhere to one another. Depending on the species, turtles and tortoises lay hard or soft eggs. Several species lay eggs which are nearly indistinguishable from bird eggs. The bird egg is a fertilized gamete (or, in the case of some birds, such as chickens, possibly unfertilized) located on the yolk surface and surrounded by albumen, or egg white. The albumen in turn is surrounded by two shell membranes (inner and outer membranes) and then the eggshell. The chicken eggshell is 95-97% calcium carbonate crystals, which are stabilized by a protein matrix. Without the protein, the crystal structure would be too brittle to keep its form and the organic matrix is thought to have a role in deposition of calcium during the mineralization process. The structure and composition of the avian eggshell serves to protect the egg against damage and microbial contamination, prevention of desiccation, regulation of gas and water exchange for the growing embryo, and provides calcium for embryogenesis. Eggshell formation requires gram amounts of calcium being deposited within hours, which must be supplied via the hen's diet. The fibrous chicken shell membranes are added in the proximal (white)

isthmus of the oviduct. In the distal (red) isthmus mammillae or mammillary knobs are deposited on the surface of the outer membrane in a regular array pattern. The mammillae are proteoglycan-rich and are thought to control calcification. In the shell gland (similar to a mammalian uterus), mineralization starts at the mammillae. The shell gland fluid contains very high levels of calcium and hydrogen carbonate. The thick calcified layer of the eggshell forms in columns from the mammillae structures, and is known as the palisade layer. Between these palisade columns are narrow pores that traverse the eggshell and allow gaseous exchange. The cuticle forms the final, outer layer of the eggshell. While the bulk of eggshell is made of calcium carbonate, it is now thought that the protein matrix has an important role to play in eggshell strength. These proteins affect crystallization, which in turn affects the eggshell structure. Moreover, the concentration of eggshell proteins decreases over the life of the laying hen, as does eggshell strength. In an average laying hen, the process of shell formation takes around 20 hours. Pigmentation is added to the shell by papillae lining the oviduct, coloring it any of a variety of colors and patterns depending on species.

Egg Michael Ruhlman, 2014-04-08 In this innovative cookbook, James Beard award-winning author Michael Ruhlman explains why the egg is the key to the craft of cooking. For culinary visionary Michael Ruhlman, the question is not whether the chicken or the egg came first, it's how anything could be accomplished in the kitchen without the magic of the common egg. He starts with perfect poached and scrambled eggs and builds up to brioche and Italian meringue. Along the way readers learn to make their own mayonnaise, pasta, custards, quiches, cakes, and other preparations that rely fundamentally on the hidden powers of the egg. A unique framework for the book is provided in Ruhlman's egg flowchart, which starts with the whole egg at the top and branches out to describe its many uses and preparations -- boiled, pressure-cooked, poached, fried, coddled, separated, worked into batters and doughs, and more. A removable illustrated flowchart is included with this book. Nearly 100 recipes are grouped by technique and range from simple (Egg Salad with Tarragon and Chives) to sophisticated (nougat). Dozens of step-by-step photographs guide the home cook through this remarkable culinary journey.

How to Wrap Five Eggs Hideyuki Oka, 2008-10-14 Traditional Japanese packaging is an art form that applies sophisticated design and natural aesthetics to simple objects. In this elegant presentation of the baskets, boxes, wrappers, and containers that were used in ordinary, day-to-day life, we are offered a stunning example of a time before mass production. Largely

constructed of bamboo, rice straw, hemp twine, paper, and leaves, all of the objects shown here are made from natural materials. Through 221 black-and-white photographs of authentic examples of traditional Japanese packaging—with commentary on the origins, materials, and use of each piece—the items here offer a look into a lost art, while also reminding us of the connection to nature and the human imprint of handwork that was once so alive and vibrant in our everyday lives. This classic book was originally published under the title *How to Wrap Five More Eggs* in 1975. The eminent American designer George Nelson praised the work featured here, saying, “We have come a long, long way from the kind of thing so beautifully presented in this book. To suit the needs of super mass production, the traditional natural materials are too obstreperous . . . and one by one we have replaced them with the docile, predictable synthetics. . . . What we have gained from these [new] materials and wonderfully complicated processes to make up for the general pollution, rush, crowding, noise, sickness, and slickness is a subject for other forums. But what we have lost for sure is what this book is all about: a once-common sense of fitness in the relationships between hand, material, use, and shape, and above all, a sense of delight in the look and feel of very ordinary, humble things. This book is thus . . . a totally unexpected monument to a culture, a way of life, a universal sensibility carried through all objects down to the smallest, most inconsequential, and ephemeral things.” Now, over thirty years later, this revived classic on the art of traditional Japanese packing may leave us with the same response, and the same appreciation for the natural and utile packaging presented in this book.
