*Embedded Processor Design Challenges* Ed F. Deprettere, Stamatis Vassiliadis, 2003-07-31 This textbook is intended to give an introduction to and an overview of state-of-the-art techniques in the design of complex embedded systems. The book title is SAMOS for two major reasons. First, it tries to focus on the actual distinct, yet important problem fields of System-Level design of embedded systems, including mapping techniques and synthesis, Architectural design, Modeling issues such as specification languages, formal models, and finally Simulation. The second reason is that the volume includes a number of papers presented at a workshop with the same name on the Island of Samos, Greece, in July 2001. In order to receive international attention, a number of reputed researchers were invited to this workshop to present their current work. Participation was by invitation only. For the volume presented here, a number of additional papers were selected based on a call for papers. All contributions were refereed. This volume presents a selection of 18 of the refereed papers, including 2 invited papers. The textbook is organized according to four topics: The first is A) System-Level Design and Simulation. In this section, we present a collection of papers that give an overview of the challenging goal to design and explore alternatives of embedded system implementations at the system-level. One paper gives an overview of models and tools used in system-level design. The other papers present new models to describe applications, provide models for refinement and design space exploration, and for trade-off analysis between cost and flexibility of an implementation.
